When Should My Child First See the Dentist?

Most parents are surprised by the answer: **by your child's first birthday, or within six months of the first tooth coming in — whichever happens first.**

That feels early. There might be two teeth in there. What could a dentist possibly do?

Quite a lot, as it turns out — and almost none of it involves the drill. The first visit is about catching problems that start before most parents expect them, and about making the dental office a familiar, boring, no-big-deal place *before* anything ever hurts.

At Smiles of Aurora, we see children from age one alongside their parents and grandparents, which is exactly what "family dentist" is supposed to mean. Families from Aurora, Oswego, Montgomery, Sugar Grove, North Aurora, and across the Fox Valley bring the whole household to one office on one morning. Here are the seven questions those parents ask us most.

1. Why so early? There's barely anything to look at.

Three reasons.

Cavities start earlier than you'd think. Tooth decay in toddlers — sometimes called early childhood caries — is the most common chronic disease of childhood, and it's driven by things that are easy to fix once you know about them: bedtime bottles, sippy cups of juice carried around all day, and sharing spoons with an adult who has active decay. At a first visit we're not looking for cavities so much as for the *habits* that cause them, while there's still time to change them.

We look at more than teeth. How the jaws are developing, how the tongue moves, whether the lip and tongue ties are restricting anything, whether the bite is coming together the way it should. Small findings at one and two are much easier to address than the same findings at eight.

The first visit sets the tone for every visit after. A one-year-old who sits on a parent's lap while we count teeth and hand over a toothbrush learns that this place is fine. A five-year-old whose first-ever dental visit is for a toothache learns something very different.

The American Academy of Pediatric Dentistry's guidance for parents — first visit by the first birthday — is the standard we follow.

2. What actually happens at a first visit?

Less than you're bracing for. A typical first visit for a one- or two-year-old at our office:

- Your child sits on your lap, knee-to-knee with the dentist, so they can see your face the whole time.
- We count teeth, look at the gums and soft tissue, and check how the jaws are developing.
- We may gently clean the teeth with a small toothbrush and apply a fluoride varnish — a quick paint-on that takes seconds.
- We talk with you about brushing, diet, pacifiers, thumbs, and what to expect over the next year.
- Your child gets a toothbrush and, ideally, leaves thinking the whole thing was mildly interesting and slightly silly.

No X-rays are needed at this age unless there's a specific concern. No drilling. If your child cries, that's completely normal and does not mean the visit went badly. Most of our one-year-olds cry for exactly as long as it takes to count twenty teeth.

3. How do I brush a toddler's teeth without a wrestling match?

Start as soon as the first tooth appears, and use fluoride toothpaste from day one — that's the current recommendation from both pediatric dentists and pediatricians.

- **Under age 3:** a smear of fluoride toothpaste about the size of a grain of rice. Twice a day.
- **Ages 3 to 6:** a pea-sized amount. Twice a day. Teach spitting, but don't worry if they swallow a pea-sized amount.
- **Until about age 7 or 8:** a parent brushes, or at least finishes the job. Kids don't have the hand coordination to do it well until they can tie their own shoes.

For the wrestling match: try lying your toddler back in your lap with their head between your knees so you can see, sing the same short song every time so they know when it ends, and let them "brush" your teeth afterward. Consistency beats technique at this age. Two mediocre brushings a day beat one perfect one.

4. Is fluoride safe for kids?

Yes, in the amounts used in toothpaste and in professional varnish. Fluoride varnish is recommended for children starting at the first tooth and is one of the most studied, most

effective preventive treatments in all of dentistry. It's also the reason cavities in kids have dropped so dramatically over the past several decades.

The concern parents usually have is fluorosis — faint white flecks on the permanent teeth that can result from swallowing too much fluoride while those teeth are forming. The rice-grain and pea-sized amounts above are set specifically to prevent that. Use the right amount, supervise brushing, and there's nothing to worry about.

If your household drinks well water — common in Sugar Grove, Big Rock, Kaneville, and the rural parts of Kane and Kendall Counties — tell us. Well water usually isn't fluoridated, and we may recommend supplements.

5. My child sucks their thumb / uses a pacifier. Should I worry?

Not yet. Thumb-sucking and pacifiers are normal and self-soothing, and most children stop on their own between two and four.

The habit becomes a dental concern if it continues past about age four, when the permanent front teeth are getting ready to come in. Persistent sucking at that stage can push the upper front teeth forward, narrow the upper jaw, and create an open bite where the front teeth don't meet. Those changes are correctable — Dr. Charlie Malzenski treats many of them later with clear aligners — but it's far easier to help a child stop the habit than to fix the bite afterward.

Our advice: pacifiers are easier to retire than thumbs, so if you can choose, choose the pacifier. Start winding it down around age two. And ask us at each visit — we'll tell you when it's time to get serious.

6. Baby teeth fall out anyway. Do cavities in them really matter?

Yes, and this is the misconception that causes the most harm.

Baby molars don't fall out until age 10 to 12. A cavity in a two-year-old's molar has a decade to cause pain, infection, and — this is the part parents don't hear — damage to the permanent tooth developing directly underneath it. An abscessed baby tooth can scar or discolor the adult tooth forming below.

Baby teeth also hold space. When one is lost early to decay, the neighbors drift into the gap, and the permanent tooth that was supposed to come in there has nowhere to go. That's the origin of a lot of the crowding that ends up in braces or aligners as a teenager.

Treating cavities in baby teeth is not about the baby tooth. It's about the adult tooth behind it.

7. Do I need a pediatric dentist, or can our family dentist see my child?

For most children, a family dentist who is comfortable with kids and sees them regularly is a great fit — and there's a real advantage to your child seeing the same team you see, in the same office, on the same morning.

A pediatric specialist makes sense for children with significant medical complexity, very extensive decay requiring hospital sedation, or severe dental anxiety that hasn't responded to a gentle approach. If your child needs that level of care, we'll tell you plainly and refer you to a colleague we trust. We'd rather your child get the right care than keep the appointment.

Setting Your Child Up for a Good Visit

A few things that make the first (and second, and tenth) visit go better:

- **Schedule in the morning,** when little ones are rested and fed.
- **Don't over-prepare.** "We're going to the dentist and they're going to count your teeth" is enough. Avoid "it won't hurt," which introduces the idea that it might.
- **Don't share your own dental anxiety.** Kids read faces. If you've had hard experiences, our post on managing dental anxiety is for you — and you're welcome to let the other parent bring them.
- **Bring the whole family.** Watching an older sibling or a parent get a cleaning first is the best preparation there is.

We serve families across Aurora (60502–60506), North Aurora, Montgomery, Boulder Hill, Sugar Grove, Oswego, Yorkville, Bristol, Plano, Batavia, Big Rock, Kaneville, Hinckley, Campton Hills, and the surrounding Fox Valley communities, with hours as early as 7am and as late as 7pm on select days so appointments fit around school and work.

Frequently Asked Questions

Q: My child is 3 and has never been to a dentist. Is it too late? A: No. The best time was age one; the second-best time is now. Just book it. Three-year-olds usually do very well.

Q: How often should kids see the dentist? A: Every six months, the same as adults. Children with a history of cavities may be seen every three to four months for fluoride.

Q: When do kids need X-rays? A: Usually not before age four or five, and then only when the back teeth are touching so we can't see between them, or when there's a specific concern. We use digital sensors that minimize exposure.

Q: When should my child see an orthodontist? A: The American Association of Orthodontists recommends a first orthodontic evaluation around age seven. We do that screening at regular checkups and will tell you if and when early treatment makes sense.

Q: Do you take Illinois All Kids / Medicaid for children? A: Please call **630-349-5889** and our team will check current plan participation for you.

Book the Whole Family on One Morning

If your child has a tooth and hasn't seen a dentist, the right time is now. If your family is scattered across three different offices, we'd love to simplify that.

Call 630-349-5889 or schedule online and tell us you're booking a first visit. We'll pair it with your own checkup if you'd like, and we'll make sure your child leaves thinking the dentist is no big deal — which is exactly the point.

Writer's Notes (not for publication)

Word count: ~1,850 words (publication content).

Outside link (1): AAPD Parent FAQ (https://www.aapd.org/resources/parent/faq/). Verify URL before publishing; the AAPD reorganizes its site periodically.

Facts to confirm with the clinical team before publishing: SOA sees children from age 1 (stated by owner); confirm fluoride varnish is offered at first visits; confirm the referral threshold language matches actual practice; confirm Medicaid/All Kids participation answer (FAQ currently defers to a phone call).
