AP PRECALCULUS · UNIT 1.5 · WORKSHEET VERSION B

Name: _____ Date: _____ Period: _____

1. For $P(x) = 2(x + 2)^2(x - 3)x$, state the degree, all real zeros, and each multiplicity.

2. Factor completely over the real numbers: $P(x) = x^3 - x^2 - 14x + 24$.

3. A polynomial has real coefficients and one zero, $2 - 3i$. State the required non-real zero and explain.

4. A real-coefficient polynomial has zeros $x = -2$ (multiplicity 3), $x = 3$, $x = 4i$, and $x = 2 + 3i$. Find its least possible degree.

5. Write a monic polynomial of least degree with real coefficients and zeros $x = -2$ (multiplicity 2) and $x = 3i$.

Name: _____ Date: _____ Period: _____

6. Given $P(x) = x^3 + 2x^2 + 9x + 18$ and a zero $3i$, find all zeros and factor P over the complex numbers.

7. Find all complex zeros and write a linear factorization: $P(x) = x^3 - 3x^2 + 2x - 6$.

8. Use equally spaced inputs to identify the degree of this polynomial from its table.

x	0	1	2	3	4	5
$P(x)$	1	4	15	46	109	216

9. Classify $f(x) = 2x^6 + 3x^2 - 4$ as even, odd, or neither. Prove using $f(-x)$.

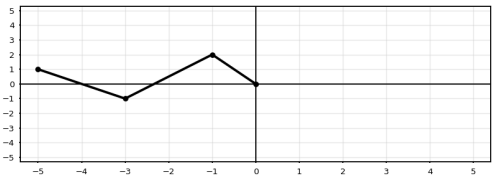
10. The table gives a function defined on these inputs. Classify as even, odd, or neither and justify.

x	-2	-1	0	1	2
$f(x)$	-2	-3	0	3	2

Name: _____ Date: _____ Period: _____

11. An even function h has $h(-4) = 6$, $h(2) = 4$, $h(-1) = -3$. Find $h(4)$, $h(-2)$, $h(1)$.

12. The displayed left-half graph belongs to a(n) even function. Complete the graph for $0 \le x \le 5$ and list the coordinates of the reflected marked points.



13. An odd function g has $g(-3) = -4$ and $g(5) = 9$. Find $g(3)$, $g(-5)$, and the average rate of change on $[-3, 5]$.

14. Solve $(x + 2)^2(x - 3)(x - 6) \le 0$. Use a sign chart and interval notation.

15. For $f(x) = x^2 + 4$ and $g(x) = 8$, solve $f(x) \ge g(x)$. State the x-intervals where f is on/above g.
