Swap Crypto Across Chains: 700+ Coins, No Sign-up | xswap.to

Service Overview & Navigation

xswap.to is a non-custodial crypto swap form designed to enable cross-chain exchange of native cryptocurrency assets without mandatory account creation or identity verification.

Platform Navigation & Internationalization

- **Core Navigation:** Exchange | Currencies | Track Order | Guides | Telegram bot
- **Supported Languages:**
- 🇬🇧 English
- 🇮🇷 فارسی
- 🇷🇺 Русский
- 🇸🇦 العربية

Key Value Pillars

- **No KYC** : No account creation, email requirement, or ID upload required to initiate a swap.
- **Non-custodial** : Funds are exchanged directly to the user's private wallet; the platform holds no account balances.
- **Cross-chain** : Move value seamlessly across disparate blockchain protocols.
- **Native assets** : Swap real, native cryptocurrencies across their respective networks.

Technical Specifications & Swap Operational Mechanics

Sample Transaction Execution Parameters

Below is an operational snapshot of a representative exchange pair (Bitcoin to Solana):
Parameter,Observed Value / Details
From Asset,BTC (Bitcoin)
To Asset,SOL (Solana)
Exchange Rate,"1 BTC ≈ 853.857 SOL (Floating rate; spot rate ~ $64,862.10 USD per BTC to $74.16 USD per SOL)"
Estimated Network Fee (Payout),0.000612 SOL
Estimated Deposit Fee,0.0000146 BTC
Estimated Processing Time,1–15 minutes
Alternative Execution Channel,Swap in Telegram

Operational & Security Warnings

- **Network Specificity Warning:** Users must enter a receiving address corresponding strictly to the selected network (e.g., Solana). Sending coins to an address on an incorrect network can lead to permanent loss of funds.

- **Memo / Destination Tag Requirement:** Certain assets require a memo or tag. Transferring such funds without the required memo/tag may result in unrecoverable funds.

No Account Needed to Start

Users can execute crypto swaps without creating an account or submitting identity documentation. The platform never requests seed phrases or private keys. The exchanged coins are sent directly to the destination wallet specified by the user.
Compliance Note: In rare circumstances, an exchange partner's automated compliance system may pause a transaction to perform a verification check before processing can resume.

Popular Swaps & Cross-Network Transfers

Direct Asset Pairs

- BTC → XMR | XMR → BTC
- BTC → ETH | ETH → BTC
- BTC → SOL | SOL → BTC
- BTC → USDT | USDT → BTC
- XMR → ETH | ETH → XMR
- ETH → SOL | SOL → ETH
- ETH → USDT | SOL → USDT
- BTC → LTC | LTC → BTC
- BTC → XRP | XRP → USDT
- BTC → BNB | BTC → TON
- BTC → TRX | TRX → USDT
- ZEC → ETH | TON → XMR

Inter-Network Asset Bridging & Conversions

- USDT TRC-20 to ERC-20
- USDT ERC-20 to TRC-20
- USDT BEP-20 to TRC-20
- USDT TRC-20 to BEP-20
- USDT TRC-20 to Solana
- USDT TRC-20 to TON
- USDC ERC-20 to Solana
- USDC ERC-20 to Base
- ETH Ethereum to Base
- ETH Ethereum to Arbitrum One

Supported Currencies & Network Coverage

Supported Coins & Tokens

The platform supports 700+ coins and tokens across various network implementations:

- Bitcoin (BTC)
- Ethereum (ETH)
- Tether (USDT)
- USD Coin (USDC)
- Solana (SOL)
- Monero (XMR)
- XRP
- BNB
- TRON (TRX)
- Gram (TON)
- Litecoin (LTC)
- Dogecoin (DOGE)
- Cardano (ADA)
- Zcash (ZEC)
- Kaspa (KAS)
- Hedera Hashgraph (HBAR)
- Avalanche (AVAX)
- Chainlink (LINK)
- All coins directory

Supported Blockchain Networks

Swaps can be processed across several discrete network environments:

- Ethereum
- BNB Smart Chain
- Solana
- Base
- Arbitrum One
- Polygon PoS
- OP Mainnet (Optimism)
- TRON
- TON
- Avalanche C-Chain
- Celo
- Aptos
- Cardano

Frequently Asked Questions (FAQ)

What is xswap.to?

xswap.to is a crypto swap web interface. Users select the input and output currencies, provide a payout address, and receive a one-time deposit address. An integrated exchange partner executes the trade via API and routes the output asset directly to the user's receiving wallet. xswap.to does not hold custodial balances.

Do I need an account to swap?

No account, registration, email address, or identity verification upload is required to execute a transaction. Users must never share private keys or seed phrases. In limited instances, partner compliance screening may temporarily hold an order for review.

Which coins and networks does it cover?

The system features over 700+ coins and tokens sourced from exchange partner listings. Assets residing on multiple networks (e.g., USDT across TRON, Ethereum, BNB Smart Chain, Solana, and TON) are indexed as discrete choices.

How do the rate and fees work?

The service utilizes floating exchange rates. Rate estimates presented in the interface incorporate both exchange margins and payout network transaction fees. Users pay independent network fees when dispatching their initial deposit. Pair-specific minimum limits are displayed directly in the swap widget.

What decides how long a swap takes?

Processing duration is determined primarily by blockchain network performance. Orders require a set number of block confirmations on the deposit chain before output tokens are transferred and confirmed on the receiving chain. Order lifecycle phases proceed as follows: Waiting for Deposit → Confirming → Exchanging → Sending → Finished

What should I do if something goes wrong?

Users should check their order page to retrieve the status and Transaction ID. Recent local orders are accessible via the Track Order page. For issues involving missing memos, wrong-network deposits, or stalled swaps, users must contact technical support via Telegram (@xswap_to) with their Transaction ID. Because blockchain transactions are irreversible, support reviews issues on a case-by-case basis and refunds cannot be guaranteed.
