Effect of the deworming treatment on Tangos 1 Elementary School's students

LILIBETH T ANGELES

ABSTRACT

Deworming is a crucial preventative care procedure for lowering parasites (both internal and external) and enhancing your health. Since the Department of Health oversees the DEWORMING program at Tangos I Elementary School, We promote deworming's beneficial effects and practical application to every students and parents. According to the World Health Organization (WHO), school-aged children often have the highest rates of parasite transfer to adults. Any age group's level of worm infection intensity. In Moreover, the most economical method of delivery giving children regular deworming medication schools because they provide an easily accessible, large and ongoing infrastructure, along with a knowledgeable a workforce that is actively involved in the community.

INTRODUCTION

Malnutrition and tissue damage can be brought on by parasitic worms such as whipworms, hookworms, and roundworms. they don't show any symptoms or evident damage, but occasionally they impact the nerves or even reach the eyes. In some instances, they might result in irreversible nerve or eye damage or even blindness. We promote deworming at Tangos 1 Elementary School and demonstrate the positive effects to motivate children in order to maintain each student's good health and lifestyle.

CONCLUSION

A study found a significant increase in height and weight after deworming , which suggests positive effects of deworming among the pupils in Tangos I Elementary School in reducing the risks of stunting and underweight in children. Moreover, previous also found significant effects of deworming on reducing risks of stunting in children.

RECOMMENDATION

The researcher recommend the annual or biannual giving of deworming to every pupil, a single doze albendazole, it is recommended as a public heakth intervention for all young children.

STATEMENT OF THE PROBLEM

How to increase the number of students who consent to ydeworming?

REFLECTION

Children are most vulnerable to worm infections, as their immune system is not yet fully developed. Untreated worm infections prevent children's healthy growth, cause poor nutrition and reduce their capacity to concentrate and learn.

METHODOLOGY

The belief that investing in child health and nutrition can generate improvements in individual's future quality of life is the rationale for many policy initiatives around the world. Yet there remains limited evidence on the casual impacts of child health gains on adult living standards, especially in developing countries. This study contributes evidence that addresses leading methodological concerns, by using variation in child health.

RESULTS AND DISCUSSION

Deworming is a process to eliminate worms, most frequently tape , round and hookworms. Many people believe that deworming is only necessary for children and is not necessary for adults. However, numerous studies state that it is necessary for adults as well. Albendazole in a dose of 400 mg. From the result of the previous year it increase almost 25 %.
