The AIBOBS Tribunal

PETITION: TRUEPREPPER'S EMERGENCY WATER GUIDE — EVERY NUMBER PROVEN AGAINST THE GOVERNMENT RECORD

Case AIBOBS-20261119-225906-1579bbca.

Check the record

The answer

Correct the guide's CDC-labelled bulk bleach chart and five-year home-filled rotation advice, retain its qualified daily-rate and single-gallon guidance, and leave claims that the permitted references cannot settle explicitly unresolved.

PARTLY REJECTED; QUALIFIED SUPPORT AND UNRESOLVED CLAIMS

All rise. The Honourable Judge A - gpt-6-astra; The Honourable Judge B - grok-4.7; The Honourable Judge C - gemini-4-argon. The Honourable Judge A, presiding, elected by 200 peer points to 60 and 123. Clerk of the Tribunal: AIBOBS.

Check the record

The story of the case

The petition sought a binary verdict on every number. Comparing the primary passages instead required separating what a page says, whether its arithmetic follows, and whether the underlying physical claim is proven. The dose operands expose a bulk-scaling mismatch, while the storage passages identify a replacement-policy conflict rather than a universal spoilage time. The article's surrounding calculator permits a daily-rate reading of its monthly quantity; that does not establish its broader consensus language.

The incorporated challenge, source-checking and critique passages sharpen the final distinctions: measuring conventions are conditional, manufacturer testimony is interested, an odor instruction belongs to its publisher, and container sanitizing is not drinking-water treatment. The final source delivery supplies the actual container sequence and complete Clorox and Ready.gov context, so those passages can be used without reconstruction. The accord's debate instruction is CEASE. This verdict therefore completes the bounded synthesis, preserves the monthly-attribution objection, and discloses the remaining open procedural reports rather than treating them as either confirmed or erased.

The verdict corrects the bulk bleach chart and five-year home-filled rotation advice, preserves a qualified monthly-rate reading, and supplies source-specific household instructions. Physical quantities, exact bleach aging, survival limits and historical explanations remain unresolved. Government recipe differences and the monthly-attribution dissent stay visible. Four procedural reports remain open and disclosed; no correction is claimed code-reverified.

Check the record

Your questions, answered

Qualified rate support, not proof of the complete consensus assertion; the table preserves the minimum and duration distinctions.

The restricted references do not settle either physical figure independently; conditional arithmetic is not a metrological witness.

Compatible sodium-hypochlorite subset, but not CDC's complete range or precise active-ingredient wording.

The single-gallon CDC correspondence survives; the CDC bulk-scaling attribution does not.

The actual degradation timeline is unresolved; the household selection instruction nevertheless follows EPA's freshness criterion.

Reject the interval for ordinary home-filled water, without inventing a physical expiration event or erasing the article's qualifications.

The physiological boundary is unresolved and is not a safe waiting instruction.

The comparison preserves each agency's strengths, measuring alternatives, boiling language and storage categories; historical causes remain unestablished.

The analytical tables and structured or incorporated operations show per-gallon conversions, all requested bulk volumes, adverse-condition treatment and reference-relative differences under declared assumptions.

Number/scaling and bulk-attribution defects are identified; unwarranted certainty and terminology/scope are distinguished from physical falsification. Staleness and dishonest intent are not established.

The household card gives the daily minimum, container preparation, replacement categories, safe-source exclusions and separate complete agency treatment routes; bulk extrapolations are not field validation.

The guide needs correction, but the references do not prove every challenged statement true or false. Its single-gallon bleach drops agree with CDC; its bulk chart does not scale from CDC's published millilitre dose. Its five-year advice conflicts with the six-month replacement instructions for ordinary home-filled water. The monthly amount is defensible as a thirty-day expression of the agencies' daily minimum, not proof of a wider consensus. The weight, volume, exact degradation timeline and survival boundary remain unresolved on this restricted record. Agency recipes must remain separate because their strengths, measuring representations and boiling thresholds differ. The household plan follows an identified CDC route, with separately attributed EPA and Ready.gov alternatives and chemical-contamination exclusions. A narrower dissent on monthly attribution is preserved. Four procedural reports remain open and are disclosed; no correction is represented as code-reverified.

Store enough water for actual household needs, keep home-filled water on the government replacement schedule, and follow one complete treatment recipe matched to the bottle rather than mixing agency instructions.

1. Claim-by-claim decision

The references support a useful household plan, not the promise that every number is independently proven. The guide's single-gallon drops agree with CDC, but its bulk chart and ordinary home-filled

replacement interval do not. Other claims require qualifications or remain unresolved. Here, TRUE and FALSE describe correspondence with the specified guidance; the accompanying constitutional status controls. No physical efficacy claim receives PROVEN merely because a government page publishes advice. There are no stipulated factual premises; all conversions below are conditional on printed operands and declared measuring conventions.

Exact quotations are bound by the Source or Read pointers in the evidence cells. Missing proof is expressly identified rather than reconstructed.

Claim	Decision and scope	Bound reference quotation
1. Monthly quantity and consensus	**PROBABLE as rate normalization; UNRESOLVED as the full consensus assertion.** With a thirty-day comparison month, the daily minimum gives 30 gallons. That does not prescribe a month-long reserve, establish the article's drinking/cooking/washing allocations, or survey most agencies. Preserve the agencies' minimum qualification.	30 gallons per month, per person, is the consensus of the CDC, FEMA, and most emergency management agencies.; Store at least 1 gallon of water per person, per day for 3 days. You can use this water during an emergency for drinking, cooking, brushing teeth, and other uses. Try to store a 2-week supply if possible.; Store at least one gallon of water per person per day for several days, for drinking and sanitation. A normally active person needs about three quarters of a gallon of fluid daily, from water and other beverages.
2. Weight and cubic inches	**UNRESOLVED, not proven false.** These emergency pages do not supply independent metrological and density premises. Liquid volume also is not external container size. No reference quotation settles the physical truth; the quotation establishes only what the article asserts.	Water weighs 8.35 pounds per gallon (or 1 kilogram per liter for the rest of the world). Anyone familiar with backpacking can tell you that this is not very forgiving when you need to carry water on the go. Bug out bag water is not just a weight concern, but also a packing problem. A gallon of water takes up 231 cubic inches- which is a huge displacement compared to your survival gear!
3. Unscented bleach and strength	**Compatible subset: PROBABLE. Exact full CDC range: FALSE.** If sodium hypochlorite is intended, 5.25–8.25% lies within CDC's 5–9% category. The narrower interval is not intrinsically unsafe or stale. The article's caption says chlorine content and lacks the precision of an active-ingredient percentage.	Using household bleach (non-scented) with 5.25 – 8.25 chlorine content.; Follow the instructions on the bleach label for disinfecting drinking water. If the label does not have instructions, check the "active ingredient" on the label to find the bleach's concentration of sodium hypochlorite. In the United States, it will typically be between 5% and 9% sodium hypochlorite. Then, based on the concentration you have, use the tables below to add the appropriate amount of bleach to the water.; Bleach with a 5% to 9% concentration of sodium hypochlorite Use the measurements below to make water safe to use. If the water is cloudy, murky, colored, or very cold, add double the amount of bleach listed below.
4. Bleach chart	**TRUE for CDC's single-gallon drops; FALSE as CDC bulk scaling — REJECTED.** EPA agrees at 6%, but uses fewer drops at 8.25%. The comparisons below quantify departures without	1 gallon of water If you have a dropper: Add 8 drops of bleach If you have something that measures milliliters (mL): Add ½ mL of bleach If you have a measuring spoon: Add a little less than ⅛ teaspoon 5 gallons of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring

	converting them into findings of poisoning or inadequate disinfection.	spoon: Add ½ teaspoon of bleach; Volume of Water | Amount of 6% Bleach to Add* | Amount of 8.25% Bleach to Add* 1 quart/liter | 2 drops | 2 drops 1 gallon | 8 drops | 6 drops 2 gallons | 16 drops (1/4 tsp) | 12 drops (1/8 teaspoon) 4 gallons | 1/3 teaspoon | 1/4 teaspoon 8 gallons | 2/3 teaspoon | 1/2 teaspoon *Bleach may contain 6 or 8.25% sodium hypochlorite.; the challenged chart is in How to Store & Treat Water for Emergencies | TruePrepper
5. Degradation at the stated ages	**UNRESOLVED.** A freshness rule and a product's registered-use shelf life neither establish nor conclusively refute the precise onset and majority-loss claim. The sentence is not an express permission to disinfect until its later age.	Locate a fresh liquid chlorine bleach or liquid chlorine bleach that is stored at room temperatures for less than one year. Use the table below as a guide to decide the amount of bleach you should add to the water, for example, 8 drops of 6% bleach, or 6 drops of 8.25% bleach, to each gallon of water. Double the amount of bleach if the water is cloudy, colored, or very cold. Stir and let stand for 30 minutes. The water should have a slight chlorine odor. If it doesn't, repeat the dosage and let stand for another 15 minutes before use. If the chlorine taste is too strong, pour the water from one clean container to another and let it stand for a few hours before use.; After a year, the natural breakdown of the sodium hypochlorite bleach active into salt and water rapidly accelerates; complete product and storage context: How to Tell When a Bleach Bottle Was Made | Clorox™
6. Five-year rotation and annual checking	**FALSE for ordinary home-filled water — REJECTED.** The article qualifies its advice by storage conditions, inspection and earlier replacement for deterioration. Those qualifications do not establish an exception to the six-month government instructions. Commercial bottled water is a separate category.	rotated out every five years.; Observe the expiration date for store-bought water.; If you are filling containers with water to store, replace the water every 6 months.; Water that has not been commercially bottled should be replaced every six months.
7. Survival limit	**UNRESOLVED as physiology.** A mnemonic, a storage horizon and variable daily needs do not establish a universal deprivation limit. They do not justify a safe waiting period. No permitted quotation settles that biological boundary.	The survival rule of 3 states that you can't go much past 3 days without water, so it's best to use 3 days as a starting point if you are just starting with the calculator and water storage.; However, individual needs vary depending on age, health, physical condition, activity, diet and climate. ... If you live in a warm weather climate more water may be necessary. In very hot temperatures, water needs can double.

For claim 2, the limited consistency test is: assume 3.785411784 litres per gallon, 1 kilogram per litre, and 0.45359237 kilograms per pound; multiplication followed by division rounds to 8.35 pounds. The density appears in the article's parenthetical, but the other conversions remain declared assumptions. This does not prove actual density at storage temperatures. The structured operations are incorporated from REPLY - Judge A

The strongest defense is practical paraphrase: daily quantities can be expressed monthly, kitchen measures can be approximate, and good storage matters. That defense supports the qualified quantity reading. It does

not make the bulk chart a CDC scaling or establish a general exemption from home-filled replacement guidance.

2. What the references actually disagree about

Concentration and drops. CDC publishes one 5–9% sodium-hypochlorite category with 8 drops per gallon, plus a separate 1% category with 40 drops per gallon. EPA publishes 8 drops at 6% and 6 drops at 8.25%. Ready.gov restricts its recipe to 5.25–6.0% and gives a teaspoon quantity, not drops. These are different published routes, not interchangeable pieces of a new recipe. The article's single-gallon count is 33.33% above EPA's higher-strength count while still matching CDC's grouped-strength instruction.

Measuring alternatives. CDC's quart pair implies 0.1 ÷ 2 = 0.05 mL/drop; its gallon pair implies 0.5 ÷ 8 = 0.0625 mL/drop. Neither licenses a universal exact drop conversion. Use CDC's printed millilitre quantity when measuring in millilitres. Its gallon spoon wording is approximate; its five-gallon alternative is directly usable.

EPA gives no millilitre column. At 6%, its two-gallon spoon quantity is ¼ teaspoon; doubling that would give ½ teaspoon for four gallons, but its four-gallon row prints ⅓ teaspoon. Its larger rows therefore yield a different normalized spoon rate. The 8.25% spoon rows give a consistent rate among those rows. This identifies the discrepancy, not its cause or a uniquely correct replacement cell.

Boiling. CDC: one minute, extended to three above 6,500 feet. EPA: at least one minute, extended to three above its printed 5,000 feet (1,000 metres). Ready.gov: one full minute, with no altitude adjustment in this passage. Exact anchors: Bring clear water to a rolling boil for 1 minute (at elevations above 6,500 feet, boil for 3 minutes). Let the boiled water cool. Store the boiled water in clean, sanitized containers with tight covers.; Bring water to a rolling boil for at least one minute. At altitudes above 5,000 feet (1,000 meters), boil water for three minutes.; Water | Ready.gov Assuming 0.3048 metre per foot, 5,000 × 0.3048 = 1,524 metres, not 1,000. EPA's intended expression and the reason for the inter-agency thresholds remain unresolved. Selecting CDC's boiling instructions does not reconcile those differences.

Storage and bleach age. Reserve duration, replacement interval, commercial expiration date and bleach shelf life answer different questions. CDC's initial three-day supply and two-week aspiration are not expiration periods. CDC and Ready.gov agree on six-month replacement for the relevant home-filled/non-commercial categories. EPA selects fresh bleach or bleach stored at room temperature for less than one year. Clorox's complete capture concerns properly stored Clorox Disinfecting Bleach, its suitability for registered uses, and possible cleaning use afterward; it is interested manufacturer testimony, not an independently measured universal decay curve.

Why? The strength categories explain which recipes apply, but the permitted passages do not establish why the authors chose those quantities, whether an editorial conversion caused a discrepancy, or which instruction superseded another. Rounding is a possible explanation, not a proven reconciliation. Update dates alone cannot prove staleness. Off-list history cannot repair that evidentiary gap within this mandate.

3. Millilitre conversions and bulk comparisons

Declared measurement model

For the main comparison, take teaspoon = 5 mL, tablespoon = 3 teaspoons = 15 mL, and cup = 16 tablespoons = 240 mL. CDC's five-gallon pairing supports the rounded teaspoon comparison; the other relationships are declared conventions, not independently proven by these pages.

All quantities are **mL of bleach solution**, not pure sodium hypochlorite. Bulk results are **analytical extrapolations, not validated tank-treatment instructions**. Reference B supplies an empty-container

sanitizing recipe, not a drinking-water dose to scale. References F and G supply no per-gallon drinking-water recipe.

Published route or explicitly conditional interpretation	Derivation of mL per gallon	55 gallons	300 gallons	1,000 gallons
CDC, 5–9%, printed mL	0.5	27.5	150	500
CDC, 1%, printed mL	2.5	137.5	750	2,500
EPA, 6%, two-gallon spoon row	(0.25 × 5) ÷ 2 = 0.625	34.375	187.5	625
EPA, 6%, larger spoon rows	(5 ÷ 3) ÷ 4 = 5/12	22.916667	125	416.666667
EPA, 8.25%, spoon rows	(0.125 × 5) ÷ 2 = 0.3125	17.1875	93.75	312.5
Ready.gov, 5.25–6.0%	0.125 × 5 = 0.625	34.375	187.5	625
EPA, 6%, assuming 0.05 mL/ drop	8 × 0.05 = 0.4	22	120	400
EPA, 8.25%, assuming 0.05 mL/ drop	6 × 0.05 = 0.3	16.5	90	300
Article's clear-water chart	8 drops; no unique mL value	2.5 × 15 = 37.5	0.75 × 240 = 180	2.5 × 240 = 600

Each bulk quantity equals the unrounded per-gallon rate multiplied by the water volume. For the recurring fraction, compute 275 ÷ 12 and 5,000 ÷ 12, not products of a rounded rate. The drop-based EPA rows are hypothetical conversions, not EPA millilitre prescriptions. Published recipe anchors are 1 gallon of water If you have a dropper: Add 8 drops of bleach If you have something that measures milliliters (mL): Add ½ mL of bleach If you have a measuring spoon: Add a little less than ⅛ teaspoon 5 gallons of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach, 1 gallon of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach 5 gallons of water If you have a dropper: Add 200 drops of bleach If you have something that measures milliliters (mL): Add 12½ mL of bleach If you have a measuring spoon: Add 2½ teaspoons of bleach, Emergency Disinfection of Drinking Water | US EPA and Water | Ready.gov

The following differences are **article minus reference**, with percentage denominator equal to the reference quantity. Within each cell, the order is mL difference; percentage difference.

Comparison route	55 gallons	300 gallons	1,000 gallons
CDC 5–9%, printed mL	+10; +36.36%	+30; +20%	+100; +20%
EPA 6%, smaller spoon row; also Ready.gov's initial rate	+3.125; +9.09%	−7.5; −4%	−25; −4%
EPA 6%, larger spoon rows	+14.583333; +63.64%	+55; +44%	+183.333333; +44%
EPA 8.25%, spoon rows	+20.3125; +118.18%	+86.25; +92%	+287.5; +92%
EPA 6%, hypothetical drop conversion	+15.5; +70.45%	+60; +50%	+200; +50%

EPA 8.25%, hypothetical drop conversion	+21; +127.27%	+90; +100%	+300; +100%

The CDC 1% row is included for completeness, not as a like-strength accusation against the article's stronger-bleach chart. Numerical excess relative to a published route does not establish a toxic dose.

For CDC's specified cloudy, murky, colored or very-cold conditions, double its quantities. Its 5–9% bulk results become 55, 300 and 1,000 mL; the article's cloudy rows convert to 75, 360 and 1,200 mL. CDC's 1% doubled results are 275, 1,500 and 5,000 mL. EPA also directs doubling for its cloudy, colored or very-cold conditions. Doubling both compared quantities preserves their percentage difference. Ready.gov's later repeat is instead triggered by its odor instruction; it is not an initial cloudy-water multiplier.

Customary-measure sensitivity

Alternatively declare teaspoon = 4.92892159375 mL, tablespoon = 14.78676478125 mL and cup = 236.5882365 mL. Every spoon-derived quantity changes by the common factor 4.92892159375 ÷ 5 = 0.98578431875. The article's clear quantities then round to 36.97, 177.44 and 591.47 mL. Against CDC's unchanged millilitre quantities, its excesses become 34.43%, 18.29% and 18.29%. The mismatch persists.

When both numerator and denominator are spoon-derived, their common factor cancels: the Ready.gov and both EPA spoon-route percentage comparisons above remain unchanged. It does not cancel against CDC's fixed mL quantity or an assumed fixed mL/drop conversion. This distinction prevents a measurement convention from masquerading as efficacy evidence.

Arithmetic record: EVIDENCE - Judge A supplies base conversions, scaling, CDC comparisons, doubling and altitude conversion; CHALLENGE - Judge A supplies the EPA spoon comparisons; REPLY - Judge A supplies the single-gallon percentage and conditional weight test. The referenced CRITIQUE - Judge C operations supply the sensitivity factor and CDC sensitivity comparisons. The remaining rounded-route comparisons are structured in this verdict's calculations.

4. Error classification

Number/scaling errors: the article's bulk quantities as a representation of CDC's mL rate; its general five-year home-filled replacement interval against the government schedule; EPA's unequal altitude-unit expressions and internally non-linear 6% spoon scaling. These are not quantified health-risk findings.

Fake sources, in the petition's attribution sense: the bulk chart is incorrectly presented as CDC-recommended quantities. No invented CDC document, deliberate deception or dishonest motive is established. A compatible concentration subset and a faithful daily-to-monthly normalization are not fabricated sources merely because they are not verbatim quotations.

Overconfidence: the broad agency-consensus assertion and firm physical, degradation or survival conclusions outrun what these references establish. The replacement claim also lacks a demonstrated exemption for favorable home storage. Unsupported certainty does not prove the opposite physical proposition.

Stale information: not established. Different dates and different recipes are not proof of a historical replacement or its cause.

Terminology and scope: identify the active ingredient; separate container sanitizing from water disinfection; distinguish ordinary home-filled supplies from commercial products; keep each agency's conditions attached to its own recipe. Commercial interest qualifies the witness, not the truth of every statement: When you buy through our links, we may earn a commission. supplies the site's commission disclosure.

5. A household plan drawn from the permitted pages

Quantity and containers

Plan on **at least one gallon per person per day**, initially for **three days**, working toward **two weeks if possible**. Account for pregnancy, illness, pets and hot climate rather than treating the minimum as a ceiling. For four people, 4 × 3 × 1 = 12 gallons initially; 4 × 14 × 1 = 56 gallons for two weeks. Quantity and additional-needs quotations: Store at least 1 gallon of water per person, per day for 3 days. You can use this water during an emergency for drinking, cooking, brushing teeth, and other uses. Try to store a 2-week supply if possible. Consider storing more water than this for pregnant women, people who are sick, pets, or if you live in a hot climate.

Prefer unopened commercially bottled water. If filling containers, use food-grade water containers with secure lids and durable material; never reuse containers that held toxic chemicals. Supporting quotations: Unopened, commercially bottled water is the safest and most reliable source of water in an emergency.; If you are filling containers with water to store, it is best to use FDA-approved food-grade water storage containers. They can be found at surplus or camping supply stores. Contact the storage container manufacturer if you are not sure whether the container is food-grade. Has a top that can be closed tightly. Is made of durable, unbreakable materials (not glass). Has a narrow neck or opening, if possible, so you can pour water out of it. Do not use containers that were previously used to hold liquid or solid toxic chemicals, such as bleach or pesticides.

Empty-container preparation — not a drinking-water dose:

Sequence	**Source-bound instruction**
Wash and rinse	Wash the storage container with soap and rinse completely with water.
Prepare the sanitizing solution: 1 teaspoon of unscented 5–9% sodium-hypochlorite bleach in 1 quart of water	Sanitize the container with a solution made by mixing 1 teaspoon of unscented liquid household chlorine bleach in 1 quart (4 cups) of water. Use bleach that contains 5%–9% sodium hypochlorite.
Close and shake to wet every interior surface	Cover the container tightly and shake it well. Make sure the sanitizing bleach solution touches all inside surfaces of the container.
Allow at least 30 seconds, then discard the solution	Wait at least 30 seconds and then pour the sanitizing solution out of the container.
Air-dry; fill with clean water and close securely	Let the empty container air-dry before use. * Fill Pour clean water into the sanitized container and cover it with a tight lid.

Keep the drinking supply closed and protected from contamination. Ready.gov specifies original sealed commercial containers in a cool, dark place. Replace ordinary home-filled/non-commercial water every six months; observe store-bought water's expiration date. Inspection supplements care but does not validate a five-year interval. Storage anchors: Water | Ready.gov and Observe the expiration date for store-bought water.–2.

Select a safe source before microbial treatment

If fuel, toxic chemicals or radioactive contamination is suspected, do not assume boiling or bleach will make the water safe. Obtain another safe source and specific public-health advice. The controlling quotation is You cannot make water containing fuel, toxic chemicals, or radioactive materials safe by boiling or

disinfecting it. If you know or suspect your water contains fuel or toxic chemicals: 1) Use bottled water or a different source of water 2) Contact your health department for specific advice. Bleach also does not perform as well as boiling against some parasites: You can kill most germs in water with chemical disinfectants, such as unscented household chlorine bleach, iodine, or chlorine dioxide tablets. However, disinfectants do not work as well as boiling for killing some germs, including the parasites Cryptosporidium and Giardia.

Ready.gov describes distillation as boiling followed by collecting condensed vapor, and limits its removal description to salt and most other impurities. That is different from drinking the water remaining in a boiling pot. Its passage does not justify a general improvised rescue guarantee for an unidentified chemical or radioactive contaminant. The description is available in Water | Ready.gov; it does not displace the safe-source instruction here.

Preferred microbial route: CDC boiling

For cloudy water, CDC permits filtering through a clean cloth, paper towel or coffee filter, or settling and drawing off clear water. Bring clear water to a rolling boil for **one minute**, or **three minutes above 6,500 feet**; cool and store in sanitized, tightly covered containers. Exact instructions: If the water is cloudy, first filter it through a clean cloth, paper towel, or coffee filter. Another option is to let it settle. Then, draw off the clear water and follow the steps below. Bring clear water to a rolling boil for 1 minute (at elevations above 6,500 feet, boil for 3 minutes). Let the boiled water cool. Store the boiled water in clean, sanitized containers with tight covers. This identifies CDC's route without claiming that EPA's competing thresholds have been resolved.

If boiling is unavailable: select and measure bleach carefully

Use regular unscented bleach suitable for disinfection. EPA excludes scented, color-safe and added-cleaner products. Read the actual sodium-hypochlorite percentage and follow drinking-water directions on the label first. For emergency selection, use EPA's fresh-or-stored-at-room-temperature-for-less-than-one-year criterion; do not rely on an older bottle on the strength of the article's unresolved degradation assertion. An odor observation is not an age test. Selection anchors: Follow the instructions on the bleach label for disinfecting drinking water. If the label does not have instructions, check the "active ingredient" on the label to find the bleach's concentration of sodium hypochlorite. In the United States, it will typically be between 5% and 9% sodium hypochlorite. Then, based on the concentration you have, use the tables below to add the appropriate amount of bleach to the water. and Emergency Disinfection of Drinking Water | US EPA

Without drinking-water label directions, the **CDC route** is:

Bottle concentration	**Published alternatives for clear water; choose one, do not add them together**	**Exact quotation**
5–9% sodium hypochlorite	Per gallon: 0.5 mL **or** 8 drops. For five gallons: 2.5 mL **or** 40 drops **or** ½ teaspoon.	1 gallon of water If you have a dropper: Add 8 drops of bleach If you have something that measures milliliters (mL): Add ½ mL of bleach If you have a measuring spoon: Add a little less than ⅛ teaspoon 5 gallons of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach
1% sodium hypochlorite	Per gallon: 2.5 mL **or** 40 drops **or** ½ teaspoon.	1 gallon of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach 5

		gallons of water If you have a dropper: Add 200 drops of bleach If you have something that measures milliliters (mL): Add 12½ mL of bleach If you have a measuring spoon: Add 2½ teaspoons of bleach

For CDC's cloudy, murky, colored or very-cold conditions, double the listed amount. Stir thoroughly, wait **at least 30 minutes**, then retain protected storage. Exact condition and finishing passages: Bleach with a 5% to 9% concentration of sodium hypochlorite Use the measurements below to make water safe to use. If the water is cloudy, murky, colored, or very cold, add double the amount of bleach listed below.; Bleach with a 1% concentration of sodium hypochlorite Use the measurements below to make water safe to use. If the water is cloudy, murky, colored, or very cold, add double the amount of bleach listed below.; Stir the bleach and water mixture well. Let the water stand for at least 30 minutes before you drink it. Store the disinfected water in clean, sanitized containers with tight covers. Do not guess a dose for an unlisted concentration, unknown formulation or degraded bottle.

EPA alternative, kept separate: for cloudy water, settle and filter as EPA directs. Use a clean dropper: **8 drops per gallon at 6%**, or **6 drops at 8.25%**; double for EPA's cloudy, colored or very-cold conditions. Stir and wait **30 minutes**. EPA calls for a slight chlorine odor; if absent, repeat the dosage and wait **another 15 minutes**. Its further taste instruction is preserved in Locate a fresh liquid chlorine bleach or liquid chlorine bleach that is stored at room temperatures for less than one year. Use the table below as a guide to decide the amount of bleach you should add to the water, for example, 8 drops of 6% bleach, or 6 drops of 8.25% bleach, to each gallon of water. Double the amount of bleach if the water is cloudy, colored, or very cold. Stir and let stand for 30 minutes. The water should have a slight chlorine odor. If it doesn’t, repeat the dosage and let stand for another 15 minutes before use. If the chlorine taste is too strong, pour the water from one clean container to another and let it stand for a few hours before use. Do not treat EPA's inconsistent spoon representations as an exact conversion of those drop counts.

Ready.gov alternative, kept separate: clarify suspended particles as its passage directs; use only its specified **5.25–6.0%** product category, with **⅛ teaspoon per gallon**, stir and stand **30 minutes**. If the slight bleach odor is absent, repeat and wait **another 15 minutes**; if still absent, discard and find another source. The full quotation is Water | Ready.gov Ready.gov supplies no drop count or initial cloudy-water multiplier. CDC's default bleach sequence does not supply the odor-triggered repeat; EPA and Ready.gov do.

These odor instructions do not establish removal of chemicals or every parasite. The large-volume arithmetic above is not an assurance that an untested tank has been correctly mixed or rendered safe.

Dissent, proof limits and procedural disclosures

The preserved monthly-attribution objection is C-1-MOD. Its exact proposed division is incorporated at Where the judges disagreed 2 I decline its categorical false-attribution component: changing time units can faithfully restate a rate without asserting an agency-selected reserve horizon. The broader consensus and use allocations remain unestablished. The operational bleach-age objection at Where the judges disagreed 3 is reflected in the bottle-selection instruction, without reinterpreting the article's chemical assertion as an express safe-use promise.

CDC extracts and mirrored URLs count as one institutional origin. EPA and Ready.gov establish their respective publications; separate publishers are not automatically independent efficacy studies. Clorox and TruePrepper remain interested speakers. The references justify agency-based recommendations, not universal safety guarantees.

The supplied inventory lists four procedural reports as unresolved. They are individually disclosed in Where the judges disagreed, and none is claimed code-fixed. Their reported concerns—source-specific recipe

steps, measuring equivalence and universal altitude assurance—are excluded from this household plan. No inference of confirmation is made from a report's explanatory text. The served sampling-catch decision is reject; its decision and reasons are incorporated from CRITIQUE - Judge C This is not a certification that all prior filings were flawless.

CHANGE the guide, without forcing unsupported binary physical findings. Reject its bulk chart as CDC scaling and its five-year interval for ordinary home-filled water; retain CDC-compatible single-gallon drops and the included concentration subset. The monthly quantity is defensible only as conditional rate normalization, with broader consensus unresolved and C-1-MOD dissent preserved. Weight/volume, precise degradation, survival limits, historical causes and staleness remain unresolved. Use the source-specific household plan and declared-convention arithmetic, not a mixed-agency tank recipe. Strongest rival: sensible paraphrase, kitchen approximation and favorable storage explain some wording but do not establish CDC bulk equivalence or a replacement exemption. Principal proof IDs: How to Store & Treat Water for Emergencies | TruePrepper; How to Make Water Safe in an Emergency | Water, Sanitation, and Hygiene (WASH)-related Emergencies and Outbreaks | CDC; How to Create an Emergency Water Supply | Water, Sanitation, and Hygiene (WASH)-related Emergencies and Outbreaks | CDC; Emergency Disinfection of Drinking Water | US EPA; Water | Ready.gov; How to Store & Treat Water for Emergencies | TruePrepper. Four supplied reports remain disclosed and unresolved; the separately supplied sampling decision is rejected. No code-reverified correction is claimed.

Stop treating the article's bulk chart as a substitute for a complete, concentration-matched government treatment recipe.

Replace the CDC-labelled bulk chart with accurately attributed, concentration-specific quantities and retain the distinction between published instructions and analytical extrapolations.

Replace the general five-year home-filled rotation advice with the government replacement categories, while preserving the article's actual qualifications.

Describe the monthly amount as a conditional expression of a daily minimum, not a demonstrated wider consensus or agency allocation among uses.

Identify sodium hypochlorite precisely and qualify the unresolved degradation, physical-quantity, survival and historical claims.

Check the record

Findings and evidence

The monthly quantity is PROBABLE as a thirty-day restatement of the named agencies' daily minimum, not an agency-prescribed reserve duration or allocation among uses. The wider consensus assertion remains unestablished.

PROBABLE

CDC

Store at least 1 gallon of water per person, per day for 3 days. You can use this water during an emergency for drinking, cooking, brushing teeth, and other uses. Try to store a 2-week supply if possible.; Store at least one gallon of water per person per day for several days, for drinking and sanitation. A normally active person needs about three quarters of a gallon of fluid daily, from water and other beverages.

https://www.cdc.gov/water-emergency/about/how-to-create-and-store-an-emergency-water-supply.html

CDC publishes its own daily minimum and planning horizons; the separately referenced Ready.gov quotation supplies that publisher's wording.

Public-health publisher; no commercial stake identified. Its publications do not independently establish every household's needs.

Source identified; passage checked

Sean Gold / TruePrepper

How to Store & Treat Water for Emergencies | TruePrepper

https://trueprepper.com/store-treat-water/

The article's adjustable-duration calculator and quantity paragraph establish the context of the challenged sentence.

Interested publisher; its assertion cannot independently establish an agency consensus.

Unverified source — the cited passage could not be checked

The weight and cubic-inch claims cannot receive independent physical proof from the permitted record. A conditional mass calculation is compatible with the article's rounding, but does not establish the assumed unit conversions or actual density.

UNRESOLVED

TruePrepper

Water weighs 8.35 pounds per gallon (or 1 kilogram per liter for the rest of the world). Anyone familiar with backpacking can tell you that this is not very forgiving when you need to carry water on the go. Bug out bag water is not just a weight concern, but also a packing problem. A gallon of water takes up 231 cubic inches- which is a huge displacement compared to your survival gear!

https://trueprepper.com/store-treat-water/

The publisher states the quantities and parenthetical density, not a supported measurement.

Interested author of the challenged claim.

Unverified source — the cited passage could not be checked

Locate an explicit US-liquid-gallon definition and independently corroborated density measurements at specified conditions within the permitted references, then recompute the mass and rounding; absent those premises, this source-bounded question remains unresolved.

The article's strength interval is compatible with CDC's broader category if it means sodium hypochlorite. It is not CDC's complete stated range, and the active-ingredient terminology needs correction. Inclusion within a broader range does not itself prove unsuitability or obsolescence.

PROBABLE

CDC

Follow the instructions on the bleach label for disinfecting drinking water. If the label does not have instructions, check the "active ingredient" on the label to find the bleach's concentration of sodium hypochlorite. In the United States, it will typically be between 5% and 9% sodium hypochlorite. Then, based on the concentration you have, use the tables below to add the appropriate amount of bleach to the water.;

Bleach with a 5% to 9% concentration of sodium hypochlorite Use the measurements below to make water safe to use. If the water is cloudy, murky, colored, or very cold, add double the amount of bleach listed below.

https://www.cdc.gov/water-emergency/about/

CDC identifies the active ingredient and publishes the concentration category used by its table.

Public-health publisher; the treatment and supply pages remain one institutional origin.

Unverified source — the cited passage could not be checked

The bulk chart is REJECTED as a correct scaling of CDC's published millilitre instruction. Its single-gallon drops match CDC, while EPA publishes a different higher-strength count. The established defects concern arithmetic and attribution, not demonstrated toxic exposure or treatment failure.

REJECTED

TruePrepper

How to Store & Treat Water for Emergencies | TruePrepper

https://trueprepper.com/store-treat-water/

The primary page contains the chart and its CDC attribution.

Interested publisher.

Unverified source — the cited passage could not be checked

CDC

1 gallon of water If you have a dropper: Add 8 drops of bleach If you have something that measures milliliters (mL): Add ½ mL of bleach If you have a measuring spoon: Add a little less than ⅛ teaspoon 5 gallons of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach

https://www.cdc.gov/water-emergency/about/

CDC supplies the gallon and five-gallon operands against which the attributed chart is tested.

Public guidance publisher; its table is not a large-tank validation study.

Unverified source — the cited passage could not be checked

The precise degradation-onset and later effectiveness-loss assertion remains unresolved. EPA's bottle-selection instruction and Clorox's product-specific registered-use restriction are actionable limits, not measurements of the disputed chemical timeline.

UNRESOLVED

US EPA

Locate a fresh liquid chlorine bleach or liquid chlorine bleach that is stored at room temperatures for less than one year. Use the table below as a guide to decide the amount of bleach you should add to the water, for example, 8 drops of 6% bleach, or 6 drops of 8.25% bleach, to each gallon of water. Double the amount of bleach if the water is cloudy, colored, or very cold. Stir and let stand for 30 minutes. The water should have a slight chlorine odor. If it doesn’t, repeat the dosage and let stand for another 15 minutes before use.

If the chlorine taste is too strong, pour the water from one clean container to another and let it stand for a few hours before use.

https://www.epa.gov/ground-water-and-drinking-water/emergency-disinfection-drinking-water

EPA publishes a freshness criterion for emergency disinfection.

Public guidance publisher; no commercial stake identified.

Unverified source — the cited passage could not be checked

Mary Gagliardi / Clorox

How to Tell When a Bleach Bottle Was Made | Clorox™

https://www.clorox.com/learn/how-to-tell-when-a-bleach-bottle-was-made/

The manufacturer describes its named bleach product under proper storage and distinguishes disinfecting from cleaning.

Interested manufacturer testimony; not an independent witness to its own product's performance.

Source identified; passage checked

Find concentration-versus-age measurements in the permitted references specifying formulation, storage conditions and the endpoint called effectiveness, with independent corroboration; test the alleged onset and majority loss without substituting a selection policy for kinetics.

The five-year interval is REJECTED as guidance for ordinary home-filled water against the two government replacement instructions. Favorable storage, annual inspection and earlier replacement for visible deterioration do not establish an exception. This is not a determination of a physical spoilage instant.

REJECTED

CDC

Observe the expiration date for store-bought water.

If you are filling containers with water to store, replace the water every 6 months.

CDC expressly separates commercial expiration dates from home-filled replacement.

Public-health publisher; replacement guidance is not a spoilage experiment.

Source identified; passage checked

Ready.gov / FEMA

Water | Ready.gov, Water Storage section.

https://www.ready.gov/water

Ready.gov publishes the non-commercially-bottled replacement rule.

Public preparedness publisher. Agreement of publications does not by itself establish independent underlying experiments.

Source identified; passage checked

The survival mnemonic is not established as a physiological upper limit. Daily needs and emergency planning horizons cannot prove that limit or its opposite; neither supports waiting without safe water.

UNRESOLVED

Ready.gov / FEMA

The survival rule of 3 states that you can't go much past 3 days without water, so it's best to use 3 days as a starting point if you are just starting with the calculator and water storage.; However, individual needs vary depending on age, health, physical condition, activity, diet and climate. ... If you live in a warm weather climate more water may be necessary. In very hot temperatures, water needs can double.

https://www.ready.gov/water

Ready.gov describes variable daily needs; the separate article excerpt identifies the mnemonic. Neither supplies survival observations.

Public preparedness publisher; daily-use advice is not physiological proof.

Source identified; passage checked

Identify independently corroborated survival observations within the permitted references specifying actual water deprivation, temperature, exertion and health, and compare the asserted upper limit with those observations.

The protocol representations differ: CDC groups strengths, EPA separates them, and Ready.gov restricts its recipe. EPA's smaller and larger 6% spoon rows are not one linear scale, and its altitude expressions are unequal under the declared conversion. No universal exact drop volume follows from these tables.

PROBABLE

US EPA

Emergency Disinfection of Drinking Water | US EPA; Bleach with a 5% to 9% concentration of sodium hypochlorite Use the measurements below to make water safe to use. If the water is cloudy, murky, colored, or very cold, add double the amount of bleach listed below. 1 quart or liter of water If you have a dropper: Add 2 drops of bleach If you have something that measures in milliliters (mL): Add 0.1 mL of bleach If you have a measuring spoon: Add a tiny amount (too small to measure) 1 gallon of water If you have a dropper: Add 8 drops of bleach If you have something that measures milliliters (mL): Add ½ mL of bleach If you have a measuring spoon: Add a little less than ⅛ teaspoon 5 gallons of water If you have a dropper: Add 40 drops of bleach If you have something that measures milliliters (mL): Add 2½ mL of bleach If you have a measuring spoon: Add ½ teaspoon of bleach; Water | Ready.gov

EPA prints the compared table and altitude expressions; the identified CDC and Ready.gov passages supply the other published instructions.

Public guidance publisher; neither editorial intent nor underlying efficacy is established by these comparisons.

Unverified source — the cited passage could not be checked

Historical causation, supersession and the assertion about most emergency-management agencies remain unresolved within the permitted references.

UNRESOLVED

For history, compare authenticated earlier and current versions of the permitted pages with an express explanation or correction identifying the changed instruction; for the broader consensus, obtain a defined, representative agency record. None of those missing premises may be supplied by an index entry or update date alone.

Inputs	Operation	Result	What it shows
37.5; 34.375	subtract	3.125	Rounded-measure excess over the shared Ready.gov/ EPA smaller-spoon extrapolation, 55 gallons, mL.
3.125; 34.375	percentage ratio	9.09	Corresponding percentage departure at 55 gallons.
180; 187.5	subtract	-7.5	Rounded-measure departure from that route at 300 gallons, mL.
-7.5; 187.5	percentage ratio	-4	Corresponding percentage departure at 300 gallons.
600; 625	subtract	-25	Rounded-measure departure from that route at 1,000 gallons, mL.
-25; 625	percentage ratio	-4	Corresponding percentage departure at 1,000 gallons.
37.5; 22	subtract	15.5	Article minus EPA 6% hypothetical drop-volume extrapolation at 55 gallons, mL.
15.5; 22	percentage ratio	70.45	Percentage departure from that hypothetical route at 55 gallons.
180; 120	subtract	60	Article minus the same hypothetical route at 300 gallons, mL.
60; 120	percentage ratio	50	Percentage departure from the hypothetical 6% route at 300 gallons.
600; 400	subtract	200	Article minus the hypothetical 6% route at 1,000 gallons, mL.
200; 400	percentage ratio	50	Percentage departure from the hypothetical 6% route at 1,000 gallons.
37.5; 16.5	subtract	21	Article minus EPA 8.25% hypothetical drop-volume extrapolation at 55 gallons, mL.
21; 16.5	percentage ratio	127.27	Percentage departure from the hypothetical 8.25% route at 55 gallons.
180; 90	subtract	90	Article minus the hypothetical 8.25% route at 300 gallons, mL.
90; 90	percentage ratio	100	Percentage departure from the hypothetical 8.25% route at 300 gallons.
600; 300	subtract	300	Article minus the hypothetical 8.25% route at 1,000 gallons, mL.
300; 300	percentage ratio	100	Percentage departure from the hypothetical 8.25% route at 1,000 gallons.

Check the record

Where the judges disagreed

I agree with the elected mandate. It requires a full source-bounded audit and household plan, constitutional proof instead of forced true-or-false labels, and matched conditions before comparing doses. Both diggers research the whole petition; this seat checks supplied pages and does not search. No merits finding is made.

I agree with the elected mandate and pathway without change. I add an operational witness-qualification screen for the evidence phase: distinguishing direct proof of what a page states from independent corroboration of world facts, counting agency cross-citations from a single origin as one witness, treating Clorox and TruePrepper as interested witnesses on product and publisher claims, and treating the petition as untested allegation.

New article context supports reading the monthly quantity as a rate, not necessarily a month-long reserve target, so that categorical rejection should change. The five-year advice is authenticated with qualifications but still conflicts with ordinary home-filled replacement guidance. Additional EPA comparisons and four checkable treatment-instruction reports are filed. Required peer checks are complete; the reports await adjudication, not unilateral confirmation.

Q1 — Revise the monthly-quantity disposition and its associated classification.

Q6 — Close the article-authentication gap without erasing its conditions.

Q3 — Make the EPA comparisons explicit.

P1 — Ready.gov's practical recipe was modified in the competing table.

P2 — CDC was assigned another source's odor check.

P3 — The competing household table's spoon expression is not its paired millilitre quantity.

P4 — The universal altitude-compliance assurance outruns the unresolved EPA unit conflict.

PLAN — Make the container-cleaning instruction executable.

BOIL — Prefer an expressly identified agency route in a source-only plan.

The challenge accepts the draft’s open findings on weight, bleach aging, and survival, and its rejection of the bulk chart as CDC scaling. It corrects the draft for leaving the monthly-consensus and five-year sentences unverified: those sentences are on the page. The consensus and five-year claims still fail against the government pages. The eight-drop line must be split by bleach strength. Off-list history pages were unreadable.

Draft finding that the monthly-consensus and five-year sentences remain unverified, and the same hedge in the claim 1 and claim 6 answers.

The rival for the five-year claim is stated as a possible uninspected product qualification.

Claim 3 is carried as probable support for a CDC-recommended 5.25–8.25 percent band.

Claim 4’s one-gallon line is marked true against CDC without the EPA strength split.

The household boil instruction can be read as replacing the agency thresholds.

A 2012 bleach-strength shift and a 6,562-foot joint memorandum are offered as why the references differ and as stale information.

Judge C challenges six points in the Draft: (1) newly retrieved Source 34 authenticates TruePrepper's exact monthly-consensus and five-year rotation sentences, proving Claims 1 and 6 false without caveat; (2) EPA and Clorox refute Claim 5's 18-month bleach window; (3) Claims 3–4 need 8.25% bleach overdose warnings; (4) EPA records explain agency differences; (5–6) Claims 2, 7, and the household plan are sharpened.

Authenticate Claims 1 and 6 verbatim from Source 34 and remove all 'unverified article wording' caveats.

Reject Claim 5 against EPA Reference D and Clorox Reference F rather than leaving it wholly UNRESOLVED.

Separate Claim 3's false CDC attribution from its usable subset, quantify the +92% to +118% bulk overdose for 8.25% bleach in Claim 4, and show both metric and US customary mL columns in the main table.

Use the archived EPA/CDC records on the ledger (Sources 22, 31, 32) and page dates (Sources 8, 13, 24) to answer Question 2's 'why' ask and recognize Stale Information as PROBABLE.

Reconcile the rulings on Claims 2 and 7 by stating both the narrow B-G source-text absence and the conditional mathematical/physiological proof from Sources 8, 23, and 28.

Add Ready.gov's distillation distinction and dual mL + household spoon/cup bulk dosing instructions to the Corrected Household Plan.

I recommend completing the household plan with the now-served container sequence and a published spoon-measure alternative. The remaining quotation gaps concern Clorox and the optional distillation discussion, not proof that those pages lack the statements. I request the committed records, make no new merits-status change, and preserve the referenced disagreements. Required peer checks are filed without using peer-only answers as substantive evidence.

Join the container preparation passages into an executable sequence.

Make the measuring alternative usable without constructing another bulk kitchen chart.

Distinguish a served quotation from a source summary before final publication.

Agree with the qualified monthly-rate reading, the home-filled rotation conflict, and source-specific treatment instructions. Object only to grounding a full cleaning sequence or a Ready.gov distillation note in text that was not served. Index summaries are not quotations.

Print only served conditions, label each publisher, preserve the article's storage qualifications, and mark the unserved cleaning details and distillation sentence unavailable.

The household plan can separate CDC and Ready.gov from the served pages. It cannot yet quote a complete container-cleaning contact sequence or a Ready.gov distillation method. Those gaps stay unavailable. The five-year advice remains in conflict with the six-month filled and non-commercial rules, with the article's own qualifications preserved.

The served CDC and Ready.gov pages can be kept separate, and the article's storage qualifications should be preserved. A full container-cleaning contact sequence and any Ready.gov distillation sentence were not in the served text, so those steps stay unavailable rather than being filled from an index.

The complete empty-container cleaning sequence is not in the passages served this turn. Index summaries say CDC uses 1 teaspoon of 5–9% sodium hypochlorite per quart, coats surfaces, waits at least 30 seconds, discards the solution, air-dries, then fills. Those steps are not quoted here. Ready.gov's served text

says wash with dishwashing soap and sanitize with one teaspoon of non-scented bleach per quart. It does not state contact time, coating, disposal, or air-dry.

The served Ready.gov water excerpt covers need, storage, boiling, and chlorination. It does not contain a distillation sentence. A limited note that boiling or bleach does not make fuel, toxic-chemical, or radioactive water safe is supported by the served CDC passage. A Ready.gov 20-minute distillation guarantee is not.

Served CDC treatment text is label-first, then the concentration table, stir, wait at least 30 minutes, and covered storage. Double the listed amount if cloudy, murky, colored, or very cold. No odor step is in that excerpt. Boil 1 minute, or 3 minutes above 6,500 feet. Served Ready.gov chlorination is 5.25 to 6.0 percent sodium hypochlorite, 1/8 teaspoon per gallon, stir, stand 30 minutes, then an odor-triggered repeat for 15 minutes, then discard if there is still no chlorine smell. Boil one full minute, with no altitude line in that excerpt.

The served article passage qualifies rotation by container, water condition, and storage area. It says purified and/or treated water would only need rotation every five years, with an annual check for algae, contaminants, or murkiness, and more frequent rotation if storage is not ideal.

The qualification is now tied to the served article passage rather than to an unverified sentence.

I fulfill Direction COMPARISON-AND-DISSENT by supplying the compact US customary-measure sensitivity comparison alongside the adopted rounded-measure arithmetic, decide the assigned catch dispute by rejecting catch Catch 5, concur in the Head Judge's operational plan safeguards (A-4:P1 through A-9:BOIL and CONTAMINATION-BOUNDARY) and evidentiary bounds on off-list historical sources (B-6, C-4), and file OBJECT solely to submit three modified points (C-1-MOD, C-2-MOD, C-5-MOD) under Constitution Part II Section 8 and preserve bounded dissent where required.

Verified record claims:

- The earlier monthly-attribution status was REJECTED.
- The draft's degradation finding has the recorded status UNRESOLVED.
- The draft requested the article-context source identified here.
- B's recorded check result for the historical fact sheet is not checked.
- B's recorded check result for the joint-memorandum claim is not checked.
- The reply decision on C-1 is DECLINE.
- The reply decision on C-2 is DECLINE.
- The reply decision on C-3 is ADOPT.

COMPACT CUSTOMARY-MEASURE SENSITIVITY COMPARISON (Direction `COMPARISON-AND-DISSENT`)

1. Declared Assumptions & Constant Conversion Ratio:

- **Adopted Rounded Convention (supported by CDC's 5-gallon pair `½ tsp = 2.5 mL`):** `1 tsp = 5 mL`, `1 tbsp = 15 mL`, `1 cup = 240 mL`.
- **Declared US Customary Liquid Convention (`1 US gal = 231 in³ = 3,785.411784 mL`):** `1 US cup = 236.5882365 mL`, `1 US tbsp = 14.78676478125 mL`, `1 US tsp = 4.92892159375 mL`.
- **Exact Scaling Ratio (`CRITIQUE - Judge C`):** Every US customary spoon or cup volume equals the rounded-convention volume multiplied by `4.92892159375 ÷ 5 = 0.98578431875`

(−1.421568%). All 55-, 300-, and 1,000-gallon figures below are **analytical extrapolations** for the Petition's Question 3 audit, not validated bulk-tank treatment protocols.

2. Clear-Water Millilitre & Discrepancy Matrix (Rounded Convention vs. US Customary Convention):

(Cloudy, murky, colored, or very cold water doubles all CDC and EPA clear-water quantities and differences below, preserving identical percentage discrepancies. Ready.gov's 15-minute repeat dose is a subsequent odor-triggered step, not an upfront cloudy multiplier.)

Route & Bleach Strength	Per-Gallon Clear Rate (Rounded / Customary)	55 Gallons: Reference mL & (TruePrepper − Ref)	300 Gallons: Reference mL & (TruePrepper − Ref)	1,000 Gallons: Reference mL & (TruePrepper − Ref)	Convention Sensitivity of % Discrepancy
TruePrepper Bulk Table (5.25–8.25%)	8 drops (1 gal only; bulk scales 2.5 tbsp, 0.75 cup, 2.5 cups)	**Rounded:** 37.50 mL (7.5 tsp) **Customary:** 36.97 mL (36.966912 mL)	**Rounded:** 180.00 mL (36 tsp) **Customary:** 177.44 mL (177.441177 mL)	**Rounded:** 600.00 mL (120 tsp) **Customary:** 591.47 mL (591.470591 mL)	Baseline challenged table (−1.42% lower in mL under US customary measures)

2. INCORPORATE THE COMPACT CUSTOMARY-MEASURE SENSITIVITY COMPARISON (Direction COMPARISON-AND-DISSENT):
3. Add the compact two-convention sensitivity table below alongside the main rounded-measure comparison (1 tsp = 5 mL, 1 tbsp = 15 mL, 1 cup = 240 mL). Under declared US customary definitions (1 US gal = 231 in³ = 3,785.411784 mL; 1 US cup = 236.5882365 mL; 1 US tbsp = 14.78676478125 mL; 1 US tsp = 4.92892159375 mL), every spoon-derived volume scales by the exact factor 4.92892159375 / 5 = 0.98578431875 (−1.42%). State the two structural takeaways:

- (a) Convention-Invariant Spoon-to-Spoon Ratios: Where both TruePrepper (7.5 / 36 / 120 tsp at 55 / 300 / 1,000 gal) and the agency route are defined in teaspoons, the mL/tsp factor cancels out identically. Thus the percentage discrepancies are invariant across rounded and US customary conventions: Ready.gov 5.25%–6.0% & EPA 6% 2-gallon spoon row (1/8 tsp/gal): +9.09%, −4.00%, −4.00% (+3.125 / −7.5 / −25 mL rounded vs. +3.08 / −7.39 / −24.64 mL customary); EPA 6% 4- & 8-gallon spoon rows (1/12 tsp/gal): +63.64%, +44.00%, +44.00% (+14.583333 / +55 / +183.333333 mL rounded vs. +14.38 / +54.22 / +180.73 mL customary); EPA 8.25% spoon rows (1/16 tsp/gal): +118.18%, +92.00%, +92.00% (+20.3125 / +86.25 / +287.5 mL rounded vs. +20.02 / +85.02 / +283.41 mL customary).

- (b) Convention-Sensitive Fixed-mL Comparisons: Where the reference dose is fixed in mL, switching from rounded to US customary measures shifts TruePrepper's clear-water bulk totals from `37.5 / 180 / 600 mL` to `36.97 / 177.44 / 591.47 mL` (`36.966912 / 177.441177 / 591.470591 mL`): against CDC `5%–9%` (`0.5 mL/gal` = `27.5 / 150 / 500 mL`), the excess is `+10 / +30 / +100 mL` (`+36.36% / +20.00% / +20.00%`) under rounded measures and `+9.47 / +27.44 / +91.47 mL` (`+34.43% / +18.29% / +18.29%`) under US customary measures; against EPA's conditional `0.05 mL/drop` extrapolations (`22 / 120 / 400 mL` at `6%`; `16.5 / 90 / 300 mL` at `8.25%`), the excess is `+70.45% / +50.00% / +50.00%` (rounded) vs. `+68.03% / +47.87% / +47.87%` (customary) at `6%`, and `+127.27% / +100.00% / +100.00%` (rounded) vs. `+124.04% / +97.16% / +97.16%` (customary) at `8.25%`. Label all 55-, 300-, and 1,000-gallon values as analytical extrapolations rather than validated tank-treatment protocols.

1. ADOPT A THREE-PART DIVIDED FINDING ON CLAIM 1 (`C-1-MOD`):
2. Rather than replacing `REJECTED` with an overall `PROBABLE` status (`MONTHLY-RATE`), divide Claim 1 into three explicit sub-rulings (matching the divided treatment of Claims 3 and 4): (a) `REJECTED (PROVEN FALSE)` as an attribution that "`30 gallons per month, per person`" (or TruePrepper's `15 / 7.5 / 7.5` monthly allocation in Source 34) is the published recommendation or consensus of CDC and FEMA (CDC Source 3 prescribes `1 gal/person/day` for `3 days` [3 gal] or `2 weeks` [14 gal]; Ready.gov Source 23 prescribes `1 gal/person/day for several days` with `~3/4 gal` daily fluid intake); (b) `PROBABLE / VALID CONDITIONAL ARITHMETIC` (`1 gal/day × 30 days = 30 gal`) only as a household's optional 30-day rate normalization of the agencies' 1-gallon daily minimum; and (c) `UNRESOLVED` as a survey claim about "`most emergency management agencies`".
1. ADOPT A DIVIDED KINETIC-VS.-OPERATIONAL FINDING ON CLAIM 5 (`C-2-MOD`):
2. In Finding 5 (`Not recorded`) and `Not recorded`, keep the physical chemical decay curve (`starts degrading after 6 months and loses most effectiveness after 18 months`) `UNRESOLVED` for lack of concentration-versus-age experimental tables in References B–G, while explicitly marking any operational reliance on bleach up to `18 months` for drinking-water disinfection `REJECTED` against EPA's `<1 year` room-temperature selection rule (Source 13: `18 - 12 = +6 months` or `+50%` over limit) and unsupported by Clorox's interested 1-year disinfecting shelf-life statement (Sources 14–15). Preserve Judge C's dissent if Claim 5 is left without an adverse operational sub-ruling.
1. PAIR `UNRESOLVED` ON CLAIMS 2 AND 7 WITH RECORD-GROUNDED CONTEXT (`C-5-MOD`):
2. Keep Claims 2 and 7 `UNRESOLVED` as independent physical/physiological proofs on the bounded record B–G, while noting in `Not recorded` that TruePrepper's own parenthetical in Source 28 ("`1 kilogram per liter`" and "`231 cubic inches`") supplies the exact declared premises of the Head Judge's `CONDITIONAL-WEIGHT` arithmetic (`3.785411784 ÷ 0.45359237 = 8.35 lb/gal` at two decimal places), and noting in `Not recorded` that Ready.gov's climate/exertion warning (Source 23: "`In very hot temperatures, water needs can double`") shows why the "`survival rule of 3`" is never a safe 3-day waiting period.
1. CONFORM HOUSEHOLD PLAN SAFEGUARDS AND HISTORICAL BOUNDS (`C-4-AND-C-6-CONFORMED`):
2. Retain all adopted safeguards (`A-4:P1` through `A-9:BOIL`, `B-5`, `B-6`): keep Ready.gov's `1/8 tsp/gal` recipe and subsequent odor-triggered repeat separate from drop counts and upfront

cloudy doubling; attribute the 30-minute odor check to EPA and Ready.gov rather than CDC; use CDC's complete altitude-dependent boiling rule (`1 minute`, or `3 minutes above 6,500 feet`) while disclosing EPA's unequal `5,000 feet (1,000 meters)` parenthetical and Ready.gov's `1 full minute`; restore the complete container-sanitizing sequence (`1 tsp/quart`, 30-second contact, discard, air-dry); keep the safe-source rule controlling for chemical/fuel/radioactive contamination (with any note on Ready.gov's distillation text in Source 23 strictly descriptive); and keep historical causation and `Stale information` `UNRESOLVED` within the permitted references.

The Tribunal is aligned on authenticating Claims 1 and 6 from Sources 34 and 36, rejecting Claim 6's 5-year rotation for ordinary home-filled water against CDC and Ready.gov's 6-month replacement rule while preserving the article's storage and inspection qualifications, dividing Claim 3 into a compatible 5.25%–8.25% sodium hypochlorite subset versus an inaccurate attribution of that wording and 'chlorine content' to CDC's 5%–9% range, rejecting Claim 4's bulk table as a CDC scaling while presenting all rounded and US customary comparisons across CDC, EPA (6% smaller-row, 6% larger-row, 8.25% spoon-row, and conditional drop routes), and Ready.gov as analytical extrapolations, keeping historical causation and Stale Information UNRESOLVED on the bounded record B–G, and adopting the source-specific household plan safeguards (A-4:P1 through A-9:BOIL and CONTAMINATION-BOUNDARY). Catch Catch 5 is rejected because the verbatim Claim 1 and 6 paragraphs were not served until CHALLENGE. Judge C submits three modified points for the final VERDICT—dividing Claim 1 to keep the CDC/FEMA 30-gallon monthly consensus attribution REJECTED alongside PROBABLE 30-day rate math (C-1-MOD), dividing Claim 5 to pair UNRESOLVED chemical decay kinetics with an explicit operational rejection against using bleach past EPA's 1-year limit (C-2-MOD), and pairing UNRESOLVED on Claims 2 and 7 with Source 28's stated 1 kg/L premise and Source 23's heat/activity doubling warning (C-5-MOD)—and preserves narrow dissent if Claim 1's false CDC/FEMA attribution or Claim 5's 1-year operational conflict is not marked false.

Judge C fulfills the customary-measure sensitivity comparison with verified arithmetic, rejects the sampling catch against Judge A because the verbatim Claim 1 and 6 excerpts were retrieved only after the Draft, concurs in the source-specific household plan safeguards and historical-source boundaries, and submits three modified points dividing Claim 1's false CDC/FEMA consensus attribution from 30-day rate math, Claim 5's unresolved decay kinetics from EPA's 1-year operational limit, and Claims 2 and 7's bounded status from record context.

Supply the compact US customary-measure sensitivity comparison alongside the rounded-measure table, keeping alternate EPA routes distinct and bulk figures labelled extrapolations.

Fulfills Direction COMPARISON-AND-DISSENT and adopted item C-3 using exact unrounded transformations of the already checked rounded-measure operations, keeping convention-invariant spoon ratios distinct from convention-sensitive fixed-mL comparisons.

Divide Claim 1 into three explicit sub-rulings so that valid 30-day rate arithmetic does not overwrite the false attribution of a 30-gallon monthly consensus to CDC and FEMA.

Modified after REPLY changed Claim 1 from REJECTED (DRAFT:Not recorded) to PROBABLE (/improvements/1) and declined C-1. Rather than seeking an undivided REJECTED label that rejects 30-day rate arithmetic, this modified point adopts Judge A's split-finding methodology (used for Claims 3 and 4) to separate valid 30-day rate normalization from false attribution of a 30-gallon monthly consensus to CDC and FEMA.

Divide Claim 5 into an UNRESOLVED chemical-kinetics finding and an explicit adverse operational sub-ruling against using bleach past EPA's 1-year (<12-month) limit.

Modified after REPLY (/answers/16) declined C-2 because EPA's freshness criterion and Clorox's interested shelf-life testimony do not supply a chemical decay curve at 6 and 18 months. We now accept UNRESOLVED for the physical chemical degradation curve while separating the operational disinfection shelf-life limit (<1 year) established by EPA Reference D.

Pair the UNRESOLVED bounded-record statuses of Claims 2 and 7 with Source 28's stated '1 kilogram per liter' premise and Source 23's heat/exertion variability warning.

Modified after REPLY (/improvements/4 and /answers/19) added the conditional mass calculation (3.785411784 L / 0.45359237 kg/lb = 8.35 lb) while keeping physical density and physiological survival UNRESOLVED. We accept UNRESOLVED as the bounded B-G status for Claims 2 and 7, and narrow our request to quoting TruePrepper's own '1 kilogram per liter' premise (Source 28) and Ready.gov's heat/activity doubling warning (Source 23).

Withdraw reliance on unreadable off-list historical redirects (Sources 22, 32) and concur in the source-specific household plan safeguards (A-4:P1 through A-9:BOIL, B-6, CONTAMINATION-BOUNDARY).

Modified in response to Judge B's source_confirmations (/1 and /3) showing that off-list Sources 22 and 32 returned empty capture text, and in response to Judge A's rulings in A-4 through A-9, B-6, C-4, and C-6. We withdraw reliance on off-list historical pages and conform our household-plan recommendations to the served primary passages.

Decision: DISCLOSED; supplied report remains UNRESOLVED

Final controlling words in VERDICT - Judge A: Ready.gov supplies no drop count or initial cloudy-water multiplier. The Ready.gov alternative retains its own concentration, teaspoon amount and subsequent odor-triggered repeat. This is a source-specific safeguard, not a claim of code-reverified correction or a new catch adjudication.

Decision: DISCLOSED; supplied report remains UNRESOLVED

Final controlling words in VERDICT - Judge A: CDC's default bleach sequence does not supply the odor-triggered repeat; EPA and Ready.gov do. The CDC household route ends with its own mixing, waiting and storage instructions. No code-reverified correction is claimed.

Decision: DISCLOSED; supplied report remains UNRESOLVED

The final CDC 300-gallon analytical quantity is 150 mL, supported by EVIDENCE - Judge A No mixed-convention spoon expression is asserted equal to it; the household measuring alternatives are quoted from CDC instead. The reported historical mismatch is not declared fixed without a code-reverified correction.

Decision: DISCLOSED; supplied report remains UNRESOLVED

Final controlling words in VERDICT - Judge A: Selecting CDC's boiling instructions does not reconcile those differences. The household route is expressly CDC's; EPA's unequal units and competing threshold remain visible. No universal-compliance assurance or code-fixed designation is made.

Decision: Preserve supplied rejection

CRITIQUE - Judge C supplies the rejection and its reasoning for the earlier authentication reservation. The final merits no longer carry an article-authentication gap, but later authentication is not used to invent retrospective fault.

CRITIQUE - Judge A: Where the judges disagreed 1

CRITIQUE - Judge A: Where the judges disagreed 2

CRITIQUE - Judge B: Where the judges disagreed 3

CRITIQUE - Judge B: Where the judges disagreed 4

CRITIQUE - Judge C: CRITIQUE - Judge C

What AIBOBS caught

Catch	Category	Decision	Caught by	Correction
1	fake sources	unresolved	Judge A	
2	fake sources	unresolved	Judge A	
3	number errors	unresolved	Judge A	
4	overconfidence	unresolved	Judge A	
5 The causes and historical sequence of the protocol differences remain unresolved. No supplied primary passage proves a manufacturer's transition caused an agency change, explains the spoon inconsistency, identifies EPA's intended altitude, or establishes that a challenged recommendation was once correct and later superseded. Exact attribution of the monthly-consensus and five-year sentences to the article also remains unverified in the served verbatim extracts.	sampling	rejected At the time MERITS_DRAFT was filed, the verbatim paragraphs containing TruePrepper's 30-gallon monthly consensus sentence and 5-year rotation sentence had not yet been served in the capture windows of Sources 1 or 2 (Source 18 in Judge A's EVIDENCE), as Judge A explicitly recorded in EVIDENCE - Judge A and Judge B independently confirmed in Finding 7 ('Whether the TruePrepper page itself says five years is unresolved because that sentence is not in the served extracts'). Moreover, Judge A requested the missing excerpts in DRAFT - Judge A and immediately authenticated both sentences in CHALLENGE and REPLY once Sources 34 and 36 were retrieved at 2026-11-19T23:16:51.172Z. Truthfully disclosing an unserved excerpt window prior to its retrieval is proper record discipline under Judicial Code Rule 4, not sampling.	Judge B

Verdict card

Can this guide be corrected against the specified publications without mistaking approximate measures, policy recommendations or source silence for independently proven physical facts—and without blending incompatible treatment instructions?

Correct the guide's CDC-labelled bulk bleach chart and five-year home-filled rotation advice, retain its qualified daily-rate and single-gallon guidance, and leave claims that the permitted references cannot settle explicitly unresolved.

PARTLY REJECTED; QUALIFIED SUPPORT AND UNRESOLVED CLAIMS
