### EDTECH 502 Learning Log

During this EDTECH 502 course, Creating Educational Websites, I felt confident going through the course content. I had some experience with HTML and CSS, but it was a nice refresher to writing code for web development. This course made me learn more about topics that I knew a little bit about, but should know the official rules and regulations. Assignment 5 and 6 focused on web accessibility, copyright and fair use. This is now something that I pay a lot of attention to now after having to think about how to apply it to websites. These assignments connect with the MET Program Learning Outcome #4 - Ethics and AECT Standards 1: Content Knowledge (AECT #1), Standard #2: Content Pedagogy (AECT #2), Standard #3: Learning Environments (AECT #3) and Standard #4 Professional Knowledge and Skills.

Going through this course, definitely gave me some perspective on how websites look and if they are mobile friendly. The required textbook, The Non-Designer's Design Book by Robin Williams, and optional eBook, HTML & CSS: Design and build websites by Jon Duckett, were very helpful to learn more about the typography and design that makes layouts look readable and nice. It made me pay more attention to the design and development of websites that are geared towards education, which connects with the MET Program Learning Outcome #1 - Design and Development. One of the assignments was creating a virtual tour of our choosing where we had to use several multimedias. Once we were done, we had to peer review each others assignment and provide feedback on it, which connects to the MET Program Learning Outcome #3 - Evaluation and Assessment. Assignments 8 and 9 focused more on creating websites specifically intended to be added to a teacher curriculum and allowed me to showcase the MET Program Learning Outcome #2 - Pedagogy and Theory.
