University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

1. Scope

- 1.1. This document provides detailed instructions on how to properly operate the AV Etcher 2.

2. Tool Description

2.1 The AV-2 Etcher is an RIE system with five (5) etchant gases available. These are: Argon (Ar), Trifluoromethane (CHF_3), Tetrafluoromethane (CF_4), Oxygen (O_2) and Sulphur Hexafluoride (SF_6). The system is designed to etch silicon, silicon nitride, silicon oxide, photoresists, other allowed organics and semiconductor materials. It is run via Cortex software in Microsoft Windows 7 environment.

University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

3 Safety

3.1 While the chamber is closing, ensure there are no items including limb in the path where the lid rests after closing.

4 Restrictions/Requirements

4.1 Must be a qualified user on any of the AV Etcher tools

5 Required facilities

5.0 Compressed air

5.1 Chilled water

5.2 Vacuum

5.3 N₂

6 Process gases

6.1 CHF₃

6.2 CF₄

6.3 O₂

6.4 SF₆

6.5 Ar

7 Notes

7.1 The AV-2 Etcher has different etch recipes from those in AV-1 etcher in PAN.

Standard recipes from the older etchers were determined not to work well in the new etcher. A table with the recipe parameters and the etch rates has been included at the end of this SOP.

8 Operating instructions

8.1 Logging on

8.1.1 Enable the “AV-2 Plasmatherm (K3)” using the MNC Badger system

8.1.2 If login is required, select **OPERATOR** and click the **User Login** button. Enter **1234** for password.

University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

The screen image below is what you see when logged in

7.1 Vent and Loading samples

7.1.1 Click on “VENT” button on the left side of the screen

University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

- 7.1.2 Wait until the system is vented as indicated by the info section at the top of the screen. When vent is complete, click on **OPEN LID** and acknowledge. You can also select “**SERVICE**” at the bottom of the screen, then click **OPEN LID** to open the lid without needing to acknowledge.

If you are on the service menu, it should like this (below)

- 7.1.3 After the chamber lid lifts up, it will swing to the right and then come to a stop.

University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

- 7.1.4** Load your samples directly on the graphite chuck. Place glass slides along the sides of your sample(s) if you don't want your samples to shift extensively during pump down. The glass slides can be adhered to the chuck with Kapton tape.
- 7.1.5** Click on the “**CLOSE LID**” on the left side of the screen or in the **SERVICE** menu. The chamber lid should now close automatically.

7.2 Running a process

- 7.2.1** After closing the lid, click on the **AUTO VENT** box if you want the system to vent automatically upon completion of the job.
- 7.2.2** Click on “**START JOB**” to run a process.
- 7.2.3** Enter the duration of etch in min and seconds (see diagram above)
- 7.2.4** Click **START PROCESS**
- 7.2.5** The process will begin automatically. Gas flow and chamber pressure will stabilize, and then RF will turn on and ignite plasma. A process countdown timer is displayed on the top right side of the screen (as well as the feedback for the gas flow, pressure, power, etc.). When the programmed step is complete, plasma will extinguish, process will end automatically and place the system in standby mode (if **AUTO VENT** is not checked) or vent to atmosphere (If **AUTO VENT** is checked)

University of Minnesota Nano Center

AV Etcher 2 - Standard Operating Procedure

Note that if you want to abort the process before the timer goes to “0”, you can press the “NEXT STEP” button on the left side of the screen.

7.3 Unloading samples

- 7.3.1 Click on “**VENT**” button on the left side of the screen (assuming system did not vent automatically)
- 7.3.2 Once the system is vented, click “**OPEN LID**” and acknowledge or open the “**SERVICE**” menu at the bottom of the screen and then click on “**OPEN LID**”
- 7.3.3 After the chamber lid lifts up, it will swing to the right and then come to a stop.
- 7.3.4 Unload your samples
- 7.3.5 Click on the “**CLOSE LID**” button. The chamber lid should now close automatically.
- 7.3.6 Click on the “**PUMPDOWN**” button situated on the left side of the screen

7.4 Logging off

- 7.4.1 On the upper-right side of the screen, click on “**USER LOGIN**”, then click on “**LOG OUT**”.
- 7.4.2 Disable the “**AV-2 Plasmatherm (K3)**” using the MNC Badger system.

8 Trouble shooting

- 8.1 If you try to start a job while the lid is open, the tool will go into alarm. Simply click on “**ALARM**” at the bottom of the screen, and look for the “**SILENCE**” button. Then close the lid and start the job.
- 8.2 Should the system not function as intended, report problem on Badger and/or contact MNC staff responsible for the tool.

9 Process parameter table

Etch Recipes	Gases							
	CHF3	CF4	SF6	O2	Ar	Pressure	Power	Platen Temp
	Gas flow (sccm)					mT	watts	°C
FastPoly			25	4		80	100	20
O ₂ Clean Maintenance				99		100	150	20
O ₂ Clean STS				99		100	100	20
O ₂ Clean high power							300	20
Photoresist etch - 1 (low rate)				99		50	150	25
Photoresist etch - 2 (High rate)				99		100	300	25
Photoresist etch - 3 (anisotropic)				10		13	200	20
PJSOxide	25	12.5			25			
Si ₃ N ₄ (LPCVD) etch - Selectivity to oxide			20			40	50	25
Si ₃ N ₄ (LPCVD) etch - standard	10	42				80	150	25
Si ₃ N ₄ etch - anisotropic (TYB type)	25	10				50	150	25
Si etch - high rate (PR mask)	7.5		19.5			30	55	20
Si etch - precision (NIT1 type)		32		8		80	100	20
SiO ₂ etch - PJSOxide type	25	6			25	50	175	25
SiO ₂ trench etch			20			40	200	30
NB Etch - (72 CF ₄ :8 O ₂)		72		8		150	100	20
