

The way to solve an alchemist rune:

Look at the down box, this shows you the number of cells within the columns for each color.

Now look at the across, this shows you the number of cells within the rows for each color.

Put the two solutions together and you have the information for solving.

Ex: on your far right column of the down solution, nothing is colored, so no cells are colored in the column. Next, look at the 7th row in Across, it shows 9 cells are green. Down says that nothing is in the far right column, so all other cells are green. When you finish, look at how the colors from down and across fill in the rune. You should find the next rune puzzle easier to solve.
