Gathering Daily Data

Hey so what I would do is I would go to lets say AVIV ratio and then I would right click and hit "view page source". So that would give the code to the website which is where the datapoints are for the indicator.

So I would scroll until I found the data I wanted and copied it. Now this part may be different for everyone but I have a macbook so I opened this app "text/edit" and went to format and formatted it to plain text and pasted the data in there.

Then after that is done I would go into my google spreadsheet and then hit import file. You go to upload browse for the file and then import location would be "Insert new sheets" and then seperator type I would just leave detect automatically. Only time I would change the separator is if in some codes they separate data like this. '1.45667','1.234455',etc. If the code is like this then just for the separator type you can do ' and then just delete the , using conditional formatting.

Once you get this imported into google sheets it will paste horizontally. So to fix this just copy it and add new tab sheet and then go to "paste special" and hit "transposed".

Then you should be good to go to copy and paste the data wherever you need.
