

Management for the goal

-

1. Repeating the same concentration

1.1. The first task is to eliminate obstacles on the way to the goal

We place a 30 cm large transparent spherical geometric control form in front of us. In it, on the inner surface, we write a universal string for changing negative information into positive.

19751

Place a smaller target sphere on the left. This sphere should encompass all obstacles, i.e. known and unknown negative information.

We move the target sphere inside the control sphere and allow the transformation of the negative to the normative positive. The control sphere belongs to the timeless realm of origin.

The target sphere's purple transformation turns into a silver-white Norma.

We conclude by fixing the harmonic result 3x 741 and materializing 889.8.

We thank the Creator and Dr. Grabovoj.

1.2. Another task is protection on the way to the goal from dangerous, harmful and unwanted influences

The implementation of the second task is similar to the implementation of the first, but in the control sphere we enter the universal set of protection 71931, and the target sphere should capture all possible known and unknown negative influences on the way to the goal.

-

2. Automatic operation of the system after its establishment until the realization of the goal

2.1. A system for eliminating obstacles on the way to the goal

We imaginatively place the target sphere on the border of the horizon, and behind the horizon the control sphere, which has the number string 19751 on the outer surface or inside the control sphere.

The spheres shine in a silver-white light and reflect information from each other in light like two mirrors. The process of light reflection of the two-sphere system lasts until the target, when it stops working.

2.2. Protection system on the way to the destination

We use meaningful analogies according to point 1.2. and 2.2.

2.3. Permanent management

The horizon is easiest to imagine at sea. This is all just a model for our imagination, but actually this system works in non-physical dimensions.

We use the technology, which is shown in abbreviated form with [screenshots of Svetlana's YT video](#) . The target sphere to be placed on the horizon and the control sphere behind it are essential.

-

Technology is implemented imaginatively. The horizon line, for example, between the sea and the sky is only a visible symbol for transcendent-quantum interpretation to our mind.

The target sphere on the event horizon and the control sphere outside the event area constantly communicate after the system is set up. We have created a system of continuous operation.

The area beyond the event horizon means a multidimensional space that is not perceived by the 3D senses, but is superior to the lower space of 3D event area.

This technology corresponds to concepts from the theory of quantum physics. The information management shown is a specific articulation of management information.
