VITAL ATTRIBUTES SYSTEM

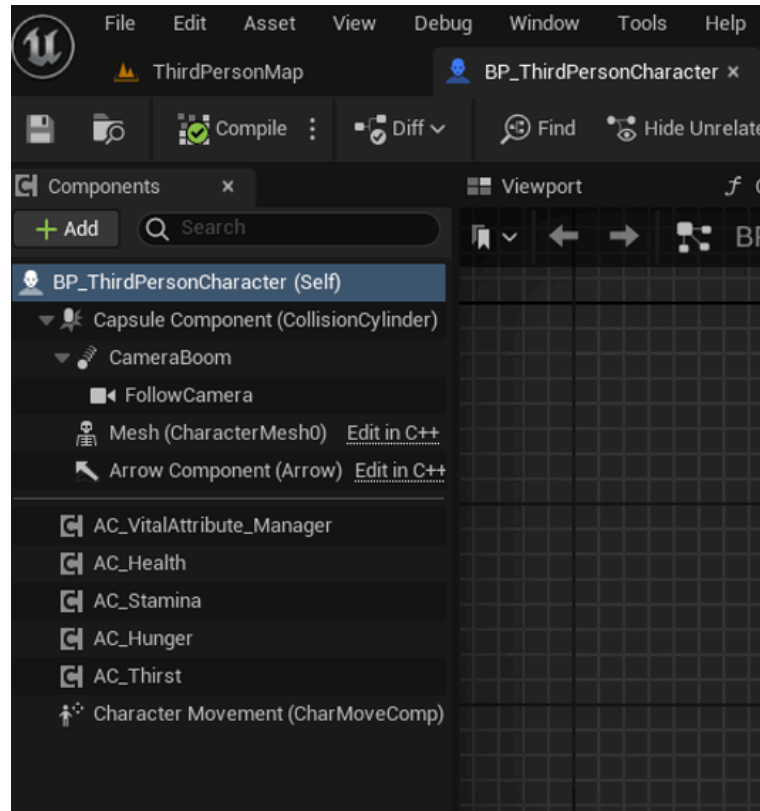

DOCUMENTATION

ASSET SETUP

Implementing this asset is quick and easy: just go to your character (or controller, but some additional modifications will be required).

Once there, you need to add the “AC_VitalAttribute_Manager” actor component, which manages the UI. Next, you can add any “AC_Main_VitalAttribute” actor component, such as “AC_Health” or “AC_Stamina”.

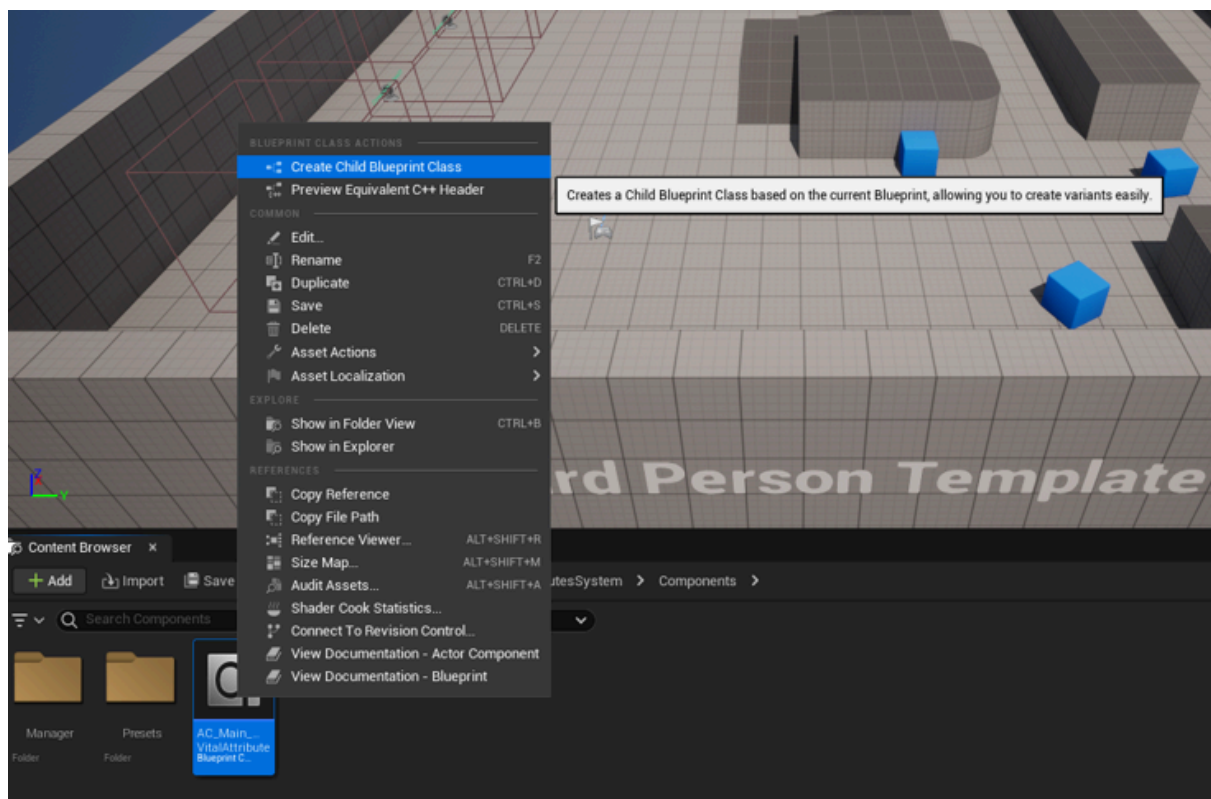

Attribute presets not added will be hidden in the main UI so that the player cannot see them.

If you implement these actor components in a controller, you'll need to change all cast to character in the “AC_VitalAttribute_Manager” actor component and “AC_Stamina” in “Specific Consumption Conditions”. To do this, you can use the “Find” tool available in every blueprint.

SETUP A CUSTOM ATTRIBUTE

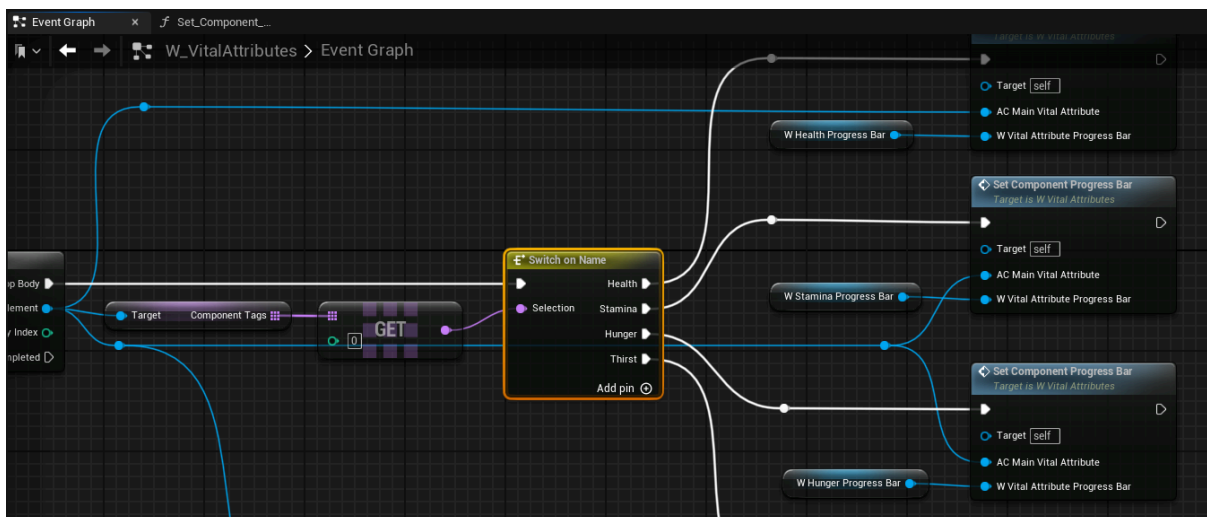

To setup a custom attribute, simply make a child of the “AC_Main_VitalAttribute” actor component.

After that, you need to add a tag (in the “Details” panel) to your component to identify it in the UI. Here's an example in the life component:

To display a progress bar (if required), open the “W_VitalAttributes” widget and add the tag to the “Switch on Name” of your custom component.

Details			
Search			
Pin Options			
Pin Names		4 Array elements	
Index [0]	Health		
Index [1]	Stamina		
Index [2]	Hunger		
Index [3]	Thirst		
Has Default Pin			

Next, simply add the “Set Component Progress Bar” node as in the other examples (see setup in the widget). You'll need to connect a progress bar of type “W_VitalAttribute_ProgressBar”, for example by duplicating it in the widget's “Designer” tab.

All that's left to do is set the values you want in your components, override the functions you need and use the events provided. To do this, I advise you to have a good knowledge of blueprint and actor components.
