

My personal teaching philosophy includes :

In order to make a successful teaching and learning process in class, every teacher has their own teaching philosophy and goal.

As a future biology teacher, firstly I will treat my students with equal to one another, regardless of age, gender, nationality, intellectual ability or personal attractiveness. As we know, teacher will face different kind of students everyday and if the teacher doesn't treat all the students equally some of them might feel inferior of themselves. But then when we give equal treats to every students, they will have confidence in themselves thus lead to a great and excellence performance in every tests and examinations.

Secondly, I will make it clear to my students that I am always available for any questions or problems regarding Biology. For me, as a teacher we should always be there for our students despite different places or time. Right now, we are living in modern and metropolitan era, where we can communicate with everyone with just one click away. Thus, I'll make a medium for me and my students to communicate in easier and efficient way. I can share some additional notes, videos and opinions about topics in Biology. Other than that, me and my students can interact actively regarding specific topic thus sharpening their mind to think more creatively.

Next, I will help my students to develop their potential by believing in them in every single thing they do. As we know, not all students can perform well in examination or test but then I believe that every person has their own potential to be successful. So as a teacher, I will continuously give them motivation to study and develop their own potential. I will also assist my student in discovering who they are, so they can express their own opinions and nurture their own ideas. Thus, the students will feel more confident and positive vibes lies in themselves.

Other than that, I will make an effort to teach biology with an enjoyable yet informative environment. I want to change our students' expectations towards Biology. Based on research, most of our students have a thoughts that biology subject is quite difficult to understands since it has a lot of facts and mechanism. So, I'll make an effort to use some other interesting ways to help student understand and study biology better such as showing more visuals or video rather than just giving a plain explanation. With this kind of way, the students will feel motivated and interested to explore more regarding Biology.

Furthermore, come early to class is also one of my teaching philosophies. For me, if we are able to come early and prepare ourselves, the students will feel more motivated and enthusiast to study. We can use the time allocated for our subject wisely without any waste of time. In order to achieve maximum value of productivity during teaching and learning process, I will make a strategy and prepare a good learning material which will help students to understand specific topic clearly. Plus, I will also make an active and informative interaction with my students to help them generate a creative ideas.

Lastly, as a teacher I want to have a good relationship between my students and their parents. For me, having a good relationship between students and their parents is essential since I can learn more about students' behaviour, personality and their needs. This kind of information is so important in order to get to know my students better. Other than that, I can also share the improvements of students personality development with parents. Parents can monitor their kids achievement from time to time with information given by me. For students, they will feel more enthusiast to study since they have supports and attention from two important sources; teachers and parents.

Based on the teaching philosophy I stated above, hopefully it can guide myself to be a dedicated and successful teacher who will always give my very best to my students.

Thank you.
