## How to create a shortened mailto: URL

For example: <a href="http://tinyurl.com/emailforfloyd">http://tinyurl.com/emailforfloyd</a>

- 1. Visit <a href="https://mailtolink.me/">https://mailtolink.me/</a> and enter your recipients, subject, and body text
  - o If you are using multiple recipients, make sure to make a comma separated list
- 2. Press "Copy code" button at the bottom to generate the web-safe content and copy it to your clipboard
- 3. Visit <a href="https://tinyurl.com/">https://tinyurl.com/</a> and paste the mailto content into the "Enter a long URL to make tiny" button. Click "Make Tiny URL"

If you are interested in doing this through a custom domain (i.e., not tinyurl.com), please reach out to me directly and I can help – if enough people reach out, I can make a doc on that process too, but it's a bit more involved!
