

How to create a shortened mailto: URL

For example: <http://tinyurl.com/emailforfloyd>

1. Visit <https://mailtoink.me/> and enter your recipients, subject, and body text
 - If you are using multiple recipients, make sure to make a comma separated list
2. Press “Copy code” button at the bottom to generate the web-safe content and copy it to your clipboard
3. Visit <https://tinyurl.com/> and paste the mailto content into the “Enter a long URL to make tiny” button. Click “Make Tiny URL”

If you are interested in doing this through a custom domain (i.e., not tinyurl.com), please reach out to me directly and I can help – if enough people reach out, I can make a doc on that process too, but it’s a bit more involved!
