

# Tweely — Privacy Policy

**Effective:** September 17, 2026

**Applies to:** Tweely browser extension v0.9.0

**Your data never leaves your browser. Tweely has no server, no account, and no analytics — there is no place for your data to go.**

The only network Tweely talks to is X itself, using the session you are already signed in to. The developer cannot see your data, because it is never sent anywhere.

Tweely is a browser extension that exports X (Twitter) followers, verified followers and following lists to CSV. This policy explains exactly what it touches — and what it deliberately does not.

## 1. What Tweely does

Tweely reads follower, verified-follower and following lists for an X account you choose, and saves them as a CSV file you download. It works entirely through the browser session you are already logged in with on x.com — the same data you could see by scrolling those lists yourself. It does not require your password and does not sign you in to anything.

## 2. Information Tweely accesses

Two kinds of data pass through the extension, both handled on your device:

| Data                                                 | Why, and what happens to it                                                                                                                                                                                                                                        |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Your X session cookies (ct0, twid)</b>            | Read from your browser to authenticate requests as you to X. ct0 is X's anti-forgery token; twid identifies which signed-in account is active. They are used only to attach to requests sent to x.com, and are never stored, copied, or transmitted anywhere else. |
| <b>Public profile data of the account you export</b> | Username, display name, bio, location, website, join date, follower/following/post counts, verification status and avatar URL — the public fields X returns for each account in the list. Written to your local database and to the CSV you download.              |

Tweely never accesses your messages, drafts, saved passwords, browsing history, or any site other than x.com and twitter.com.

## 3. Where your data is stored

All collected data lives in your browser's local storage on this device:

- **Exported records** — saved in the browser's IndexedDB, so a large export can be paused and resumed without losing progress.
- **Progress, settings and your consent** — saved in the extension's local storage (chrome.storage.local): which export is in progress, safety counters, and the fact that you accepted the in-app notice.

**None of this is uploaded.** Tweely operates no backend server and has no database of its own. Your exported data exists only in your browser and in the CSV files you save.

#### 4. What Tweely never does

- **No servers.** Nothing you export is sent to the developer or any third party — there is no server to receive it.
- **No analytics or telemetry.** The extension contains no tracking pixels, no usage analytics, and no crash-reporting SDKs.
- **No accounts.** There is no sign-up, no login to Tweely, and no user profile.
- **No selling or sharing.** Your data is never sold, rented, or shared, because it never reaches us in the first place.
- **No ads.** The extension shows no advertising and builds no advertising profile.

#### 5. Permissions, and why each is needed

| Permission                               | Purpose                                                                                                                                                       |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cookies</b>                           | To read your ct0 and twid cookies for x.com so requests can be made under your own logged-in session.                                                         |
| <b>storage, unlimitedStorage</b>         | To save your export progress and collected records locally, so large exports can be resumed. unlimitedStorage lifts the small default quota so big lists fit. |
| <b>Host access to x.com, twitter.com</b> | To send the data requests to X (and load avatar images from its CDN) with your session credentials attached. Tweely requests access to no other sites.        |

#### 6. Third-party services

**There are none.** The extension communicates only with X's own domains — x.com, twitter.com, and X's image CDN abs.twimg.com — to fetch the data you asked for. No other analytics, hosting, payment, or advertising services are involved.

Data you send to X is governed by [X's own Privacy Policy](#).

## 7. Keeping and deleting your data

Because everything is stored locally, you are in full control of it:

- Use **Clear progress** in the extension to delete a job's collected data at any time.
- **Uninstalling Tweely** removes all of its locally stored data from your browser.
- CSV files you have already downloaded are ordinary files on your computer, under your control.

## 8. Children's privacy

Tweely is a general productivity tool and is not directed to children under 13. It does not knowingly collect any personal information from children.

## 9. Changes to this policy

If this policy changes, the “Effective” date above will be updated and the revised policy published at this address. Material changes will be reflected in the extension's store listing.

## 10. Contact

Questions about this policy or your data? Reach out and we'll respond.
