

Section 1: Basic Info

Name - L.Mary Aishwarya

Email - aishu.srini97@gmail.com

Portfolio / Writing Samples (link) - https://fueler.io/aishu_0508

Instagram Handle (if any) - https://www.instagram.com/aishwarya_mary0508/

Section 2: Creative Writing Task

Q1. Script Writing (45–60 sec) - Exam Roast

Hook: “Everyone in exams: ‘I’ll pass with grace marks.’ Buddy, grace won’t save you... math might.”

Calculation/Logic: “If you studied 2 chapters out of 10, your probability of passing = $2/10 = 20\%$. That’s not grace, that’s gambling.”

Witty Punchline: “Las Vegas has better odds... go book a casino instead of an exam hall.”

CTA: “Wanna actually score? Download “**Big Math Theory**”. At least your math will pass.”

Q2. New IP Ideas (Bollywood themed)

IDEA 1 : Karan Johar’s Probability Formula

In a KJo film, Switzerland trip = 100%, family song = 100%, airport climax = 100%. Basically, his scripts are just probability equations with extra drama.

IDEA 2 : Song Sequence Statistics

Every Bollywood film has 5 songs minimum.

Chances of rain dance = 70%, foreign location = 90% — math proves it’s never “just acting” , it’s singing + dancing too.

IDEA 3 : Box Office Algebra

Box Office = Star Power² × Item Song ÷ Logic.

That's why the money multiplies, but common sense vanishes.

Section 3: Research & Insight

Q3. Math x Virality

FACT 1 :

Hook: “There are more ways to arrange a Rubik’s Cube than atoms in the universe.”

Why it’s wild: A standard 3×3 cube has 43 quintillion possible combinations — that’s 43 followed by 18 zeros.

Save-worthy angle: Great for gaming/logic reels, or “your brain is faster than you think” style content.

FACT 2 :

Hook: “The number zero was invented thousands of years after counting began.”

Why it’s wild: Ancient civilizations could count and do math, but the concept of *nothing* as a number came much later (India gets credit for it).

Save-worthy angle: Works for reels on history, culture, or “imagine math without zero” roast content.

FACT 3 :

Hook: “If you shuffle a deck of cards properly, that order has probably never existed before in human history.”

Why it’s wild: A 52-card deck has 52! (factorial) = $\sim 8 \times 10^{67}$ possible arrangements. The odds of repeating one are astronomically low.

Save-worthy angle: Great for wow-factor visuals — pan a card shuffle → overlay text → “you just made history.”

Section 4: Creative Bonus

Q4. Einstein Podcast

Episode 1: “Einstein on Dating Apps”

“Welcome back, it’s Albert Einstein — solving the mysteries of the universe, and now, your love life. In 2025, people swipe left, swipe right... I call it *quantum love*.

Here’s why: until you actually meet them, your match exists in two states — soulmate *and* total disaster. Schrödinger had his cat; you have your Tinder date.

Thought experiment: imagine opening a chat. To you, it’s full of potential. To your friends reading over your shoulder? They already see the ghosting coming. Two observers, two realities — that’s quantum mechanics in your DMs.

So remember: it’s not rejection, it’s just quantum uncertainty. Relativity? Nah, my friend. That’s just relationships.”
