The city of Dubai is again at the forefront of the future. The city has recently created passenger drones that would enable a passenger to fly over the traffic of the city. The Drones will debut in the summer of 2017 after being revealed last year at the CES conference. The drone is a single-person drone that is designed for short-medium transportation without being piloted by a person. The automated system is able to detect any malfunctions and will land as soon as a problem is found to ensure safety. Lights, internal temperature, and destination are all controlled by the passenger. The flight process is as short and brief as possible to ensure punctuality, and the passenger will always have a GPS in the cabin to know exactly where they are and where the Ehang is taking them.
