

1

The book that I got the answers from.

1 I think the author wrote this text... so people can learn some interesting facts about it and what you need to know if you are staying there.

2 My opinion changed about marine life because of the facts they added inside the text and some things they do to keep it safe.

3 I think it is important to look after marine life because a lot of animals will die from all the plastic that will be in the ocean and oil. We will also have no healthy fish to eat because they will be filled with plastic and also our future generations won't have a really good life, they won't even be allowed to go swimming in the ocean.

4 You can show kaitiakitanga to our oceans by putting your rubbish **inside** the rubbish bin and picking up any rubbish that you see lying around. (Fun fact- Goldfish that are sold in the pet stores are not allowed to be let go into the ocean because they pollute the oceans.)

2

Ecosystem-If one creature goes extinct in an ecosystem, the extinction will affect other creatures in that environment because everything is connected.(it's like a chain)

Sonar- I detected the sonar scanners were moving rapidly.

Spearfish- Some people fish with a spear./Spearfish have stretched out noses that are as sharp as a perfectly sharpened pencil.
