

Conga website

The concept is similar to: <http://congalist.com>

I would need the following:

database for conga

1st table (example)

conga id | conga name | description | creator | status| created | last update (timestamp)|
featured| featured date

2nd table

this one will be for any user that will sign up for the conga

the user management portion is being handled by a script and it has its own tables that can be later be integrated with this portion of the site

the way it works is as follows:

user creates conga => goes through all the motions submit form

admin (me) => approves/denies conga

if approved conga is posted and other users can sign up

this is what needs to happen next after a user signs up under that conga:

creator receives message stating that they need to confirm sign up of user

if confirmed new user is added to the end of the conga and the user that he signed up under is removed

an example of conga:

James - (Leader) the next sign up will be under this person

Frank - 2nd

Joe - 3rd

I sign up under James and he confirmed I did sign up so now the list would be as such

Frank - Leader

Joe - 2nd

Me - 3rd
