

NotreVoute Image Creation Guide

Definition

This guide is oriented to help create new resources for the products.

Requirements

This is the requirements per each product resource.

Naming

The naming of the files will be like the next:

PRODUCTSKU_NUMBER.webp

Number	What image should be here? (common cases)	Example
1	The heads of the coin/bullion etc	NVAG20230006_1.webp
2	The tail of the coin/bullion etc	NVAG20230006_2.webp
3....10	The box, cover, ...	NVAG20230006_3.webp

Extension

We will be using **webp** as the extension. No png or jpg will be used for the products and webp will be used as much as possible for other resources.

File size

The max expected file size will be 500KB , expecting an average of 200KB 400KB . If you see some filesize out of normal, 700KB, ... 1 MB ... then there must be something not optimized.

Format

The format for the product images will be the next:

- Transparent background
- Center in the middle
- Resolution: 2000px x 2000px
- Margin: 160px (green lines)
- Internal image: 1680px x 1680px

Any resource image that is under the 1680px size will be rescaled to fit that size.

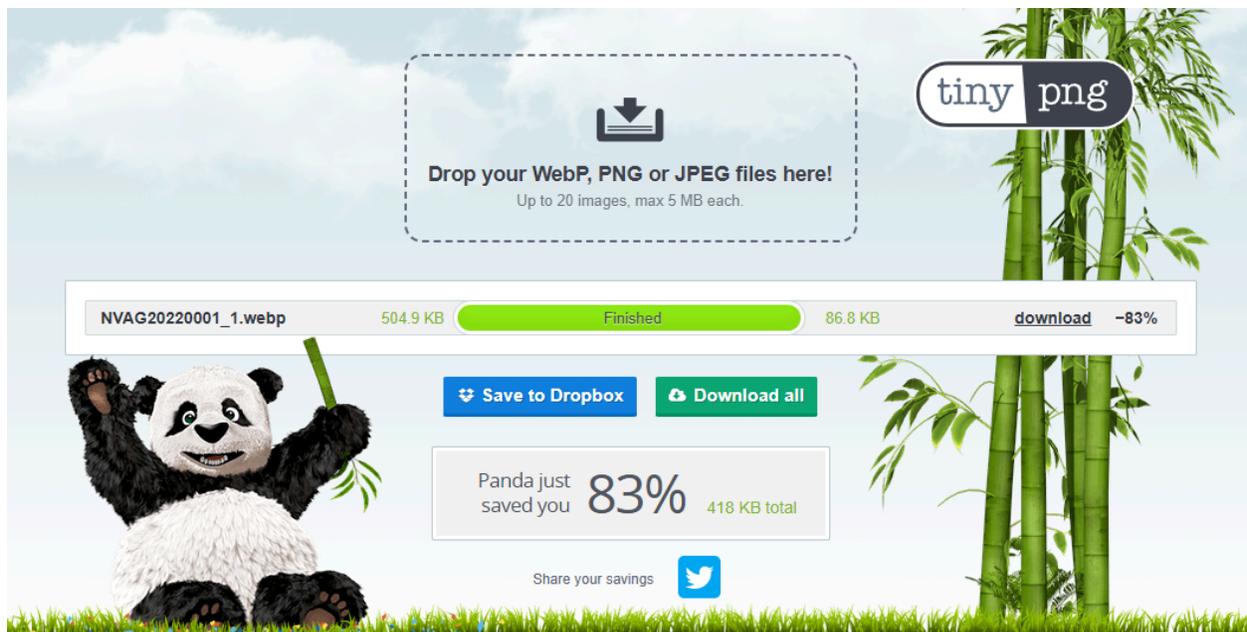

Storing

To store the images in a safe place we will store them in this folder (only admin access):

Original /Data/Resources/Products/Original

Optimization

Once we have saved the created image in the folder we will have to optimize it. For it we will use the web <https://tinypng.com/> we will drop the created imagen and generate an optimized one that will be used in the product creation.

Once we have downloaded the optimized image we will update again to google drive to the next folder.

Optimized /Data/Resources/Products/Optimized
