Product Feedback On the OMRIX App

Feedback Notes:

Below are key areas I focused on to provide feedback. I highlighted positives, negatives, and opportunities for improvement. I hope my feedback is helpful to the Omrix Project.

General Product Feedback

Positive:

The site immediately grabs your attention with that "Automate AI Agents" headline - you know exactly what you're getting into. I really like the clean black design with the bold text, it feels very modern and tech-savvy. Plus, seeing that it works with Twitter, Discord, and Telegram is reassuring since those are the platforms most Web3 folks actually use.

Negative:

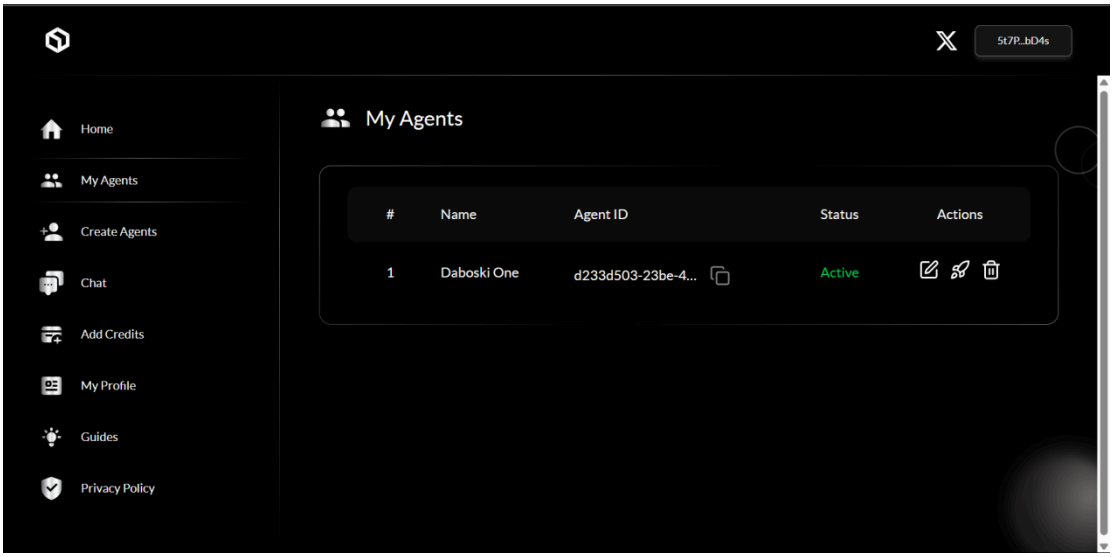

Honestly, I left the site still not totally sure what these agents actually do day-to-day. Like, are we talking chatbots? Content creators? Moderators? Some concrete examples would help a ton - maybe show a customer service bot handling inquiries or a Twitter bot that tracks trending topics.

I also couldn't find any real user stories or testimonials, which always makes me a bit hesitant. Even just a few quotes from beta users or some logos from companies testing it would build more confidence.

AI Agent Creation Experience

1. It was genuinely exciting to create my AI agent, "Daboski One." Honestly, the whole process went incredibly smoothly, way better than I expected. From the very start, getting its basic setup done and figuring out its main functions, it just felt... easy. I didn't hit any frustrating walls or confusing glitches. Instead,

everything seemed to fall into place, letting me move forward without any big delays. It was a real relief, and actually pretty cool to see how quickly I could get it up and running.

2. When it came to setting up how my agent should behave and choosing which social platforms it would interact with, I didn't run into any confusion at all. The process for configuring those behaviors was really straightforward, and picking the right social platforms was just as clear. It was a smooth experience on that front, which was a relief.

Platform Integration Experience

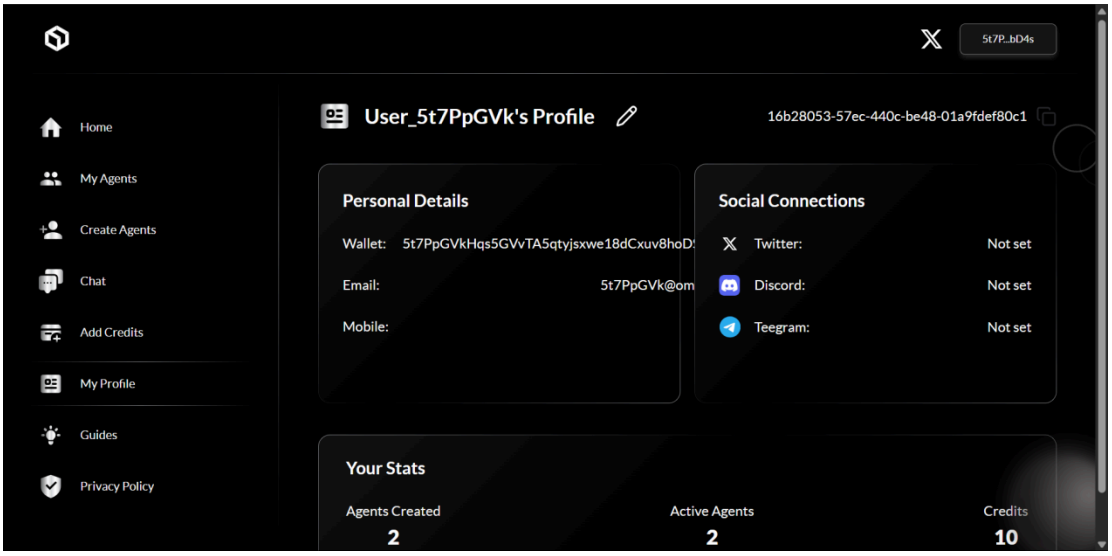

1. I did manage to get a token deployed, which was a good step! However, I couldn't figure out how to deploy it across other platforms like Twitter, Discord, or Telegram.

I looked around the site, but I just couldn't find any clear instructions or options for that. It felt like a missing piece, and I really wish there was a straightforward way to do it directly from the platform.

2. I tried to link up my social media accounts, but for some reason, I just couldn't get that to work. It was a bit frustrating, as I was hoping to integrate them seamlessly. I went through all the usual steps, clicked on the prompts, and even tried a couple of different approaches, but no matter what I did, it just didn't connect properly.

It felt like hitting a wall, and honestly, it was a bit of a letdown because I had really envisioned having that direct link.

The whole point of wanting to connect them was to make sharing and managing things so much easier, and without that functionality, it felt a little incomplete. I spent a fair bit of time trying to troubleshoot it, wondering if I was missing something obvious, but it just seemed to consistently fail. It's one of those small things that, when it doesn't work, can really interrupt your flow and make you feel like you're missing out on a key feature you expected to be there.

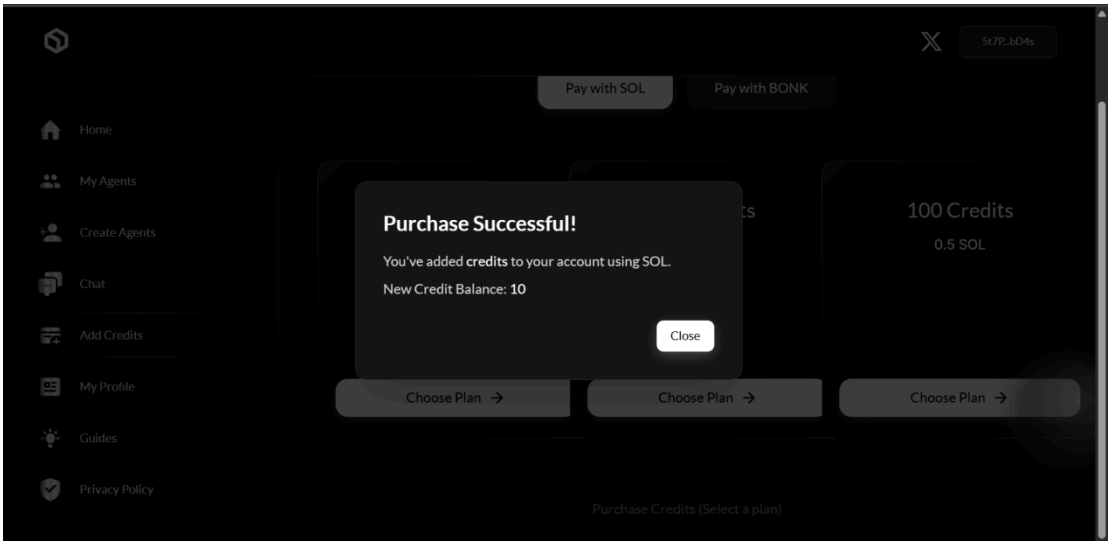

Wallet Connection and Credit Purchase

1. Connecting my wallet to grab some credits was surprisingly smooth, I have to say. Sometimes these things can be a bit clunky or confusing, but this time around, it just worked. It felt pretty seamless from start to finish.

There were no unexpected pop-ups or confusing steps. It just connected, and I was able to proceed with the purchase without any fuss.

That kind of ease really makes a difference when you're trying to get something done quickly.

2. I had absolutely no trouble at all switching between my different wallets. That part of the process was really smooth and intuitive, which was a relief.

It's good to know I have that flexibility.

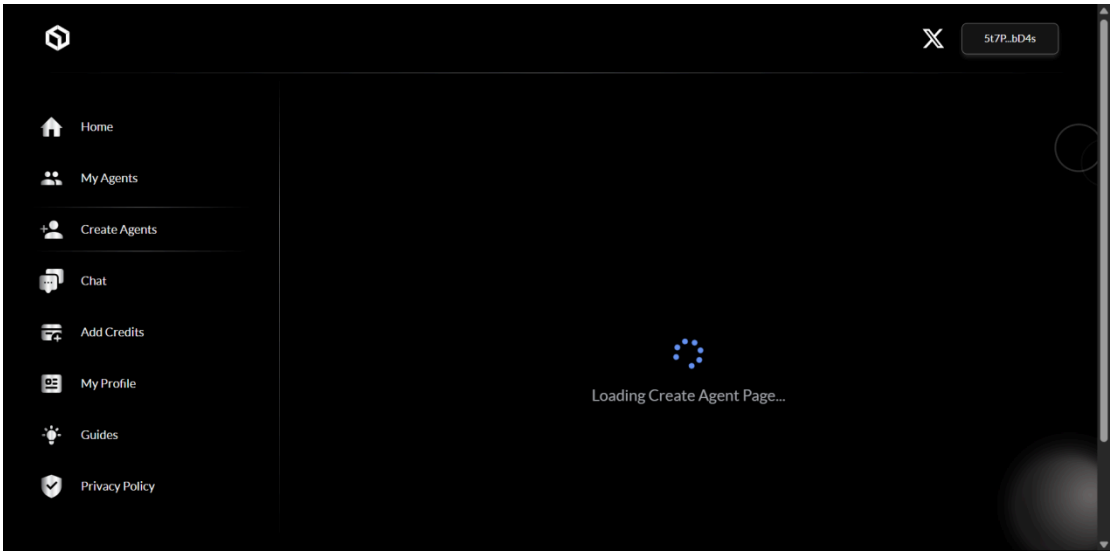

UI/UX and App Performance

1. I have to say, the app's layout was incredibly intuitive. Navigating through it felt completely natural, almost as if I had designed it myself or already had extensive experience using it.

Everything was exactly where I expected it to be, making the whole experience remarkably smooth and user-friendly.
This seamless design truly made a difference. There was no guesswork involved; every button and section was clearly labeled and logically placed, allowing me to jump right into using its features without any hesitation.

It really boosted my confidence in exploring everything the app had to offer, and I felt productive from the moment I opened it.

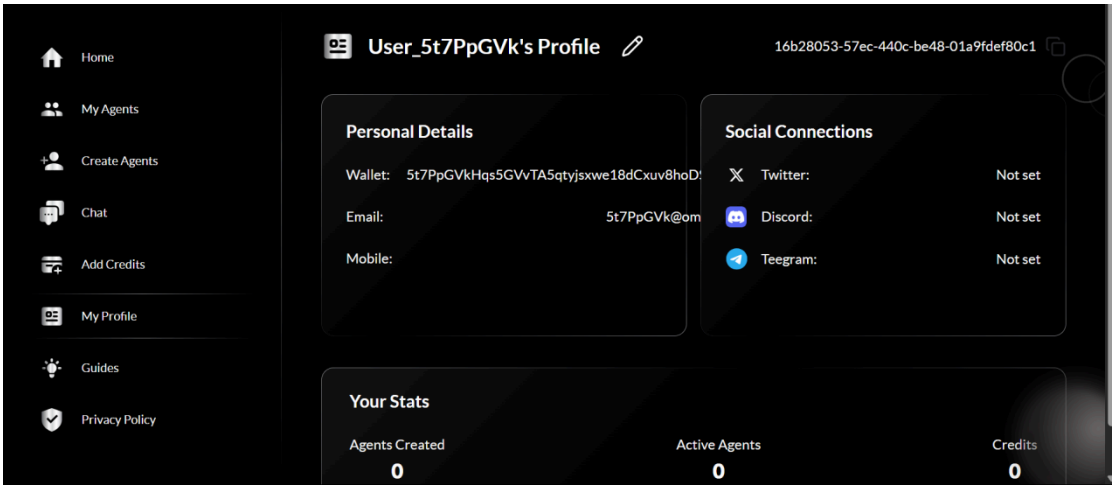

I was not able to go back to the home page on multiple occasions , instead I was being redirected to the create agent page :

2. There was a bit of a drag was the loading times. At first, I actually thought it was just my internet acting up, because things seemed to take a little longer to load than what feels reasonable these days. It wasn't a complete freeze, but just enough of a delay to make you pause and wonder.

And on another note, when I checked out the "My Profile" section, I saw some texts were overlapping. It made it a bit messy and hard to read clearly.

Just a small visual glitch, but definitely something that could make the profile section feel a lot cleaner if it were fixed.

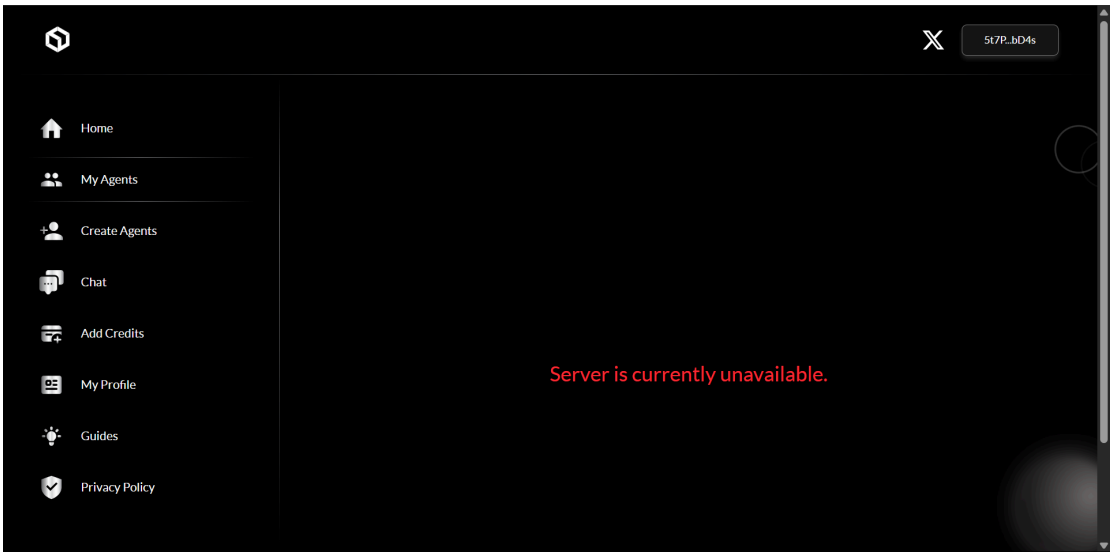

Bugs, Errors, or Unexpected Behavior

1. Deployment went pretty well for the most part, which was great. However, there were a few times when an error report would just pop up out of nowhere, and I'd have to refresh the entire site to get rid of it. It wasn't a constant problem, but it definitely interrupted the flow a bit.

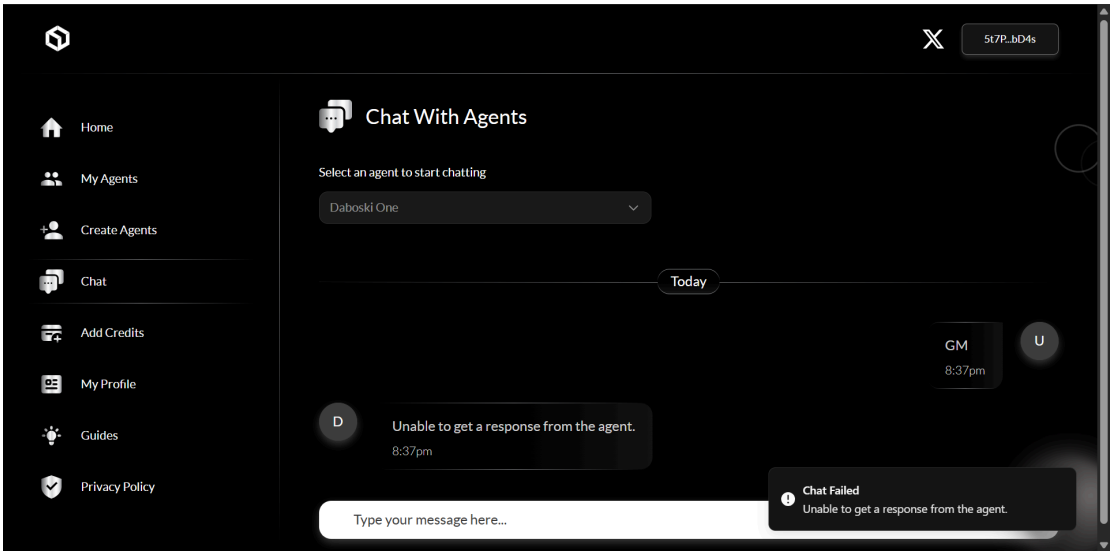

Each time it happened, it pulled me out of what I was doing. It wasn't a showstopper, but having to stop, refresh, and then get back into my rhythm was a minor annoyance that added up.

It made me wish for a smoother, uninterrupted workflow, especially when I was in the middle of something important.

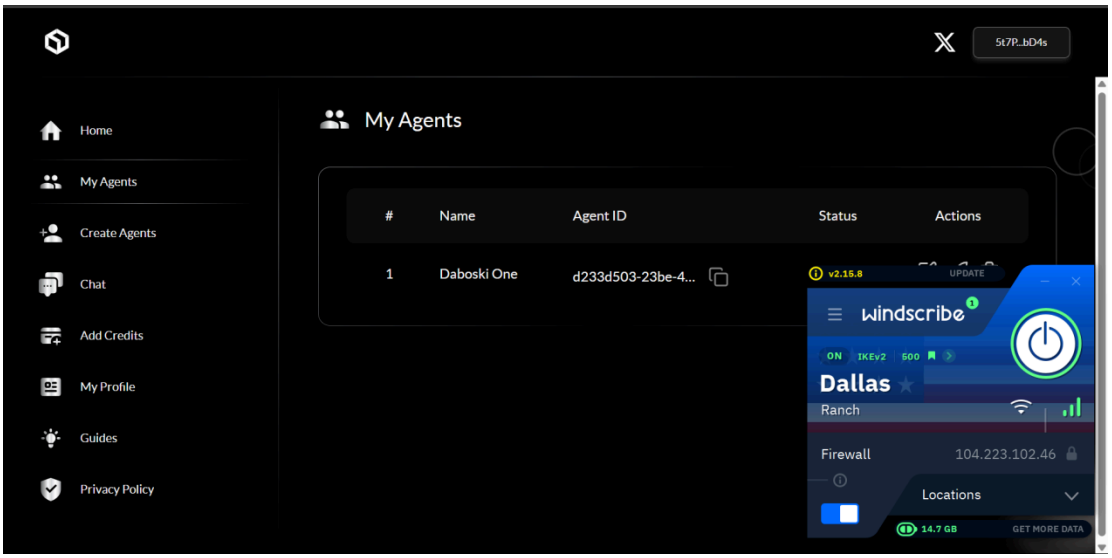

2.

- The major error message I encountered was being unable to chat with my AI agent this made it confusing. So, if there's any way to push this up the priority list, I'd be incredibly grateful. I am genuinely eager to put “Daboski One” to good use, and getting this chat functionality working would make a world of difference for me and, I imagine, for anyone else trying to engage with their AI agents.

- Also, on a couple of separate occasions, I actually had to fire up my VPN just to get onto the website. It was a bit of a hassle, you know, adding that extra step to simply access the platform.

Thankfully, after those initial hiccups, I've been able to get in smoothly without it. Still, it's definitely something that should be looked into, as it could be a real barrier for others trying to use the site.

Suggestions for Improvement

1.

- An interactive demo or sandbox for building agents.
- Pre-made agent templates (e.g., Twitter auto-responder, Discord moderator).
- A dashboard preview showing what managing agents looks like.
- Agent performance analytics.

2.

- Integrate micro-animations and hover states for CTAs (call-to-actions)
- Provide a guided onboarding flow with progress indicators
- Introduce a sticky navigation bar to structure the page
- Make sure all your buttons look the same, hover effects are consistent, and spacing feels intentional. Right now some things feel a bit random in terms of sizing and placement.
