

## Residual waste materials

Residues are each individually collected waste components, which are used as raw materials or are reused, with or without intermediate processing. One of the most common residues of GFT waste and Swill. By separately collecting residues you can save considerable costs. Proper and proper separation requires "customization" in the collection, processing, handling, processing, processing and trading of the various waste and residues. This can be adapted per times and per company to the wishes and needs of the customer.

### ***“Your business waste enjoys a second life”***

A large part of the waste that needs to be processed comes from the industry. But just like private individuals, the companies have been producing less and less waste in recent years. Moreover, just like you and I, they have to sort the waste as widely as possible, so that a large part of it is given a second life via recycling, for example as secondary or new raw material.
