

I installed New Module X and now everything is broken. Why?

Is your new module the same version as the rest of your Islandora modules? Mixing versions is the most common cause of broken Islandora. If you want to try out a new module that does not have a version for the release you're using, you will have to upgrade *everything* to the latest in-development code (also referred to as bleeding-edge code or running on HEAD).

I found something wrong in the documentation. How do I get it fixed?

Our official documentation is run as a wiki, so if you find a mistake and know what it should be corrected to, you are completely welcome to just go ahead and make that correction for yourself. Islandora thrives on the contributions of the user community and our documentation is no exception.

If you know there's a problem but don't know the solution, let us know by commenting on the documentation page or emailing community@islandora.ca, and we will do our best to address the problem as quickly as we can.

I tried installing Islandora in a Windows environment and now I hate everything. Can you help?

Unfortunately, we are unable to offer full support for Islandora in Windows environment because we are unable to properly test and ensure functionality.

Users like you have made great strides to patch Islandora for Windows on their own and we are always happy to adopt those solutions back into the code if they pass tests and code review without breaking anything else, so Islandora's compatibility with Windows has certainly improved - but for support your best bet is to ask on the listservs and hopefully connect with someone else who has experience making Islandora and Windows play nicely.
