

Greetings,

Resumes are so 2001, let's cut to the TLDR. If the following can't break through the dull and ordinary of resumes, then we might not be a match. Here is my Hollywood pitch...

A rare blend of someone who can write algorithms in Python/MySql sifting through stock/options/futures data and or parsing Twitter sentiment. Without missing a beat, happily explain in simple English why the creation of the Federal Reserve in 1913 has destroyed price discovery and given rise to cryptocurrencies.

A few quick highlights:

- [A detailed resume can be found here. \(I left WayStone at the end of 2022\)](#)
- [Click here for my futures and stock algorithm dashboard.](#) (this example when I was working with stocks and futures. Options are now behind the security wall.
- Previously Strategic Options was an SEC online registered investment advisor. I have since withdrawn my license. Too much compliance for a one man shop.
- [Here is a loom video explaining my actual options trading strategy and dashboard.](#)
- Series 65, not required for the job but just nice to have. (let it expire)
- The first algorithm I wrote in 2011, was deployed across a \$150 million portfolio.
- Expert level in Python and MySQL
-

I have written a few articles about algorithmic trading, which might not apply exactly to the job but nice to have:

- [Recommended Books for building trading algorithms](#)
- [So you want to build a financial trading algorithm?](#)
- [The Best and Worst Stock and Option Trading APIs](#)
