

# SCP-313 "Moirira"

**Class:** Keter

## **Special Containment Procedures:**

SCP-313 is to be kept in a 15' by 20' room, furnished fully with biological and genetics research equipment according to approval from at least Class B personnel or higher. All requests from SCP-313 for any furnishings (to include those that break or need replacement) should be properly routed through the supervisory team as outlined in SCP-313's log. The room is always to be sealed, and it's 1' concrete outer walls are to be inspected weekly.

Only through the authority of SCP-313's containment specialist is it allowed any physical contact with anyone. Under circumstances that are less than dire (such as described in subsection 125.2 in SCP-313's log) all contact with it must be through a dual closed-circuit system, in order to minimize risk of personal and mental injury to personnel.

## **Description:**

SCP-313 appears to be an androgynous but female human of approximately 30 to 40 years of age, determined to be of Irish origin. It is tall and slender, with biotic-like enhancements adorning much of its body. It is noted by many researchers that the right side of SCP-313's body seems to 'lack life, color and health in any form'. Whether this is tied into SCP-313's subsequent influence on living organisms around it is yet to be revealed.

Much of SCP-313's time seems devoted to it's personal 'research', though never gives much insight into the research itself despite many logged trials of questioning. There is a recorded obsession with the aspect of genetic modification, though it's unknown whether this obsession began or was caused by the ongoing research.

When allowed to conduct it's personal research, SCP-313 shows little malevolence towards researchers or other personnel. When it is restricted, confined or otherwise not allowed to conduct research, SCP-313 will go into a rage-like trance and make every attempt to break out of confinement.

SCP-313 exhibits the ability to absorb the life energy of anyone it comes into physical contact with. Any individual who experiences this ability will undergo rapid aging and, under extreme cases, rapid decomposition. This is believed to be the reason for SCP-313's constant state of fluctuating appearance and health. SCP-313 is able to reverse the ability and has even offered promising possibilities of rejuvenation, but this has only been noted in one case during one of her research experiments through surveillance cameras and cannot be entirely proven.

Due to recent worries of a containment break due to incidents in log 180330, at least one class D or lower personnel will be provided to SCP-313 every year.

## **Research Summary:**

### **Log 180330, 1:**

Subject (SCP-313) attempted a near-successful containment break after several days of being in a rage-state. Researchers came to the conclusion that this was due to the inadequacy of the provided equipment and supplies allowed to SCP-313's research.

Conversation between Dr. [REDACTED] and SCP-313 are provided below, after SCP-313 killed three researchers in an attempt to escape containment.

The conversation below was held through a closed-circuit connection.

**SCP-313:** You can't expect me to have any worth in my research with the sub-par supplies you give me.

**Dr. [REDACTED]:** Sub-par?

**SCP-313:** There's only so much research that I can do on myself, you know.

**Dr. [REDACTED]:** Wasn't your equipment enough?

**SCP-313:** Enough? [Laughs] This is barely enough to entertain a child. I need real supplies, things I can work with-

**Dr. [REDACTED]:** Like the researchers you killed?

**SCP-313:** I'd wager to say that they were volunteers for a genetic breakthrough, but call it what you may.

**Dr. [REDACTED]:** ....did you attempt a containment breach because you require live specimens?

**SCP-313:** How else will I get anywhere with my research?
