

Alumizu Keycap Acceptable QC

Machining Marks

Caps with legends might have small machining marks when you see it from some angle and under direct light. We kept changing many different angles for 2-3 minutes and found the mark shown below under direct light. It's unnoticeable in normal usage. Please refer to this video to check more: <https://i.imgur.com/E0HhPQw.mp4>

Underside

The underside of these caps will be raw aluminum on the finishing surface. Internal machining marks may exist.

Blemishes

Some caps may present small or minor blemishes such as anodization streaks or stains, or dents. We haven't any such case from our samples now, and we are not able to share any photos. But below are some standards we will set for mass production.

1. At 20CM visual distance, no more than 3 points are allowed within 1cm². Each point size should be less than 0.2mm, and the interval between each point must be greater than 30mm.
2. Stains are invisible at a visual distance of 20cm.

Fitment

We tested different manu's switches, they fit well. And we will aslo CNC chamfers on the stems, so that it can fit switches even more easily.

But please note that if you really find a switch hard to fit, please do not force them onto your stems.

Below are the switches we have tested:

WS Aurora switches

JWK Cobalt

Kailh box red

Neapolitan

Gateron Vermilion Bird

Gateron Azure Dragon

TTC Gold Pink
