

## Human Trust NFT Wallet

- **Concept Overview:**

- The Human Trust NFT Wallet enables individuals to create a global, tamper-proof digital identity profile that serves as a universal trust credential. This wallet functions as a personal trust account—more significant than a traditional bank account—accepted globally across industries and institutions. It empowers users to authorize transactions, sign agreements, apply for passports and visas, obtain credit, transfer funds, and engage in trust-compliant messaging.

- **Problem:**

- People around the world, from diverse backgrounds and varying access to resources, lack a verified, universally accepted trust account.
- This absence hinders their ability to participate fully in both the digital and real economies, limiting access to essential services like financial products, travel, and professional opportunities.
- People, looking for a new career opportunity feel stress and disappointment, facing numerous tests and cross border proofs of your qualification, which eats their money stashes moving the employment.

- **Solution:**

- Our product issues trust-certified NFTs linked to verified identity, SIM card data, geolocation, and financial authenticated records in banks. This allows individuals and businesses to prove their trustworthiness instantly and securely, anywhere in the world.

- **MVP:**

- We can bootstrap the MVP by integrating Twilio's SIM card API for verification and Worldcoin's digital passport technology to link users' mobile identities with their Trust NFT Wallets.
- In order to verify validity of financial stability we can utilize Nordigen API
