---

## Treatment Description

The **P-Shot® (Priapus Shot®)** is a non-surgical procedure that uses your body's **Platelet-Rich Plasma (PRP)** to promote penile tissue regeneration, increase blood flow, enhance erectile function, and improve size, sensitivity, and performance.

### Add-On Options (if selected):

- **P-Shot® 100 / Priapus Toxin®:** Incorporates intracavernosal injection of botulinum toxin (e.g., Botox® 100 units) to promote vasodilation and enhance erectile performance, typically for vasculogenic ED.
  - **Priapus Toxin® (Botox® without PRP):** Intracavernosal botulinum toxin for ED (without PRP).
- 

## Expected Benefits

- ✓ Improved erection firmness and quality
  - ✓ Increased penile girth and length (results vary)
  - ✓ Enhanced sensitivity and satisfaction
  - ✓ Support for Peyronie's disease
  - ✓ Enhanced results when combined with add-ons
- 

## Potential Risks

- Bruising, swelling, redness, tenderness at injection sites
- Temporary firmness or nodules
- Infection (rare)
- No guarantee of improvement

Botulinum toxin add-ons (P-Shot® 100, Priapus Toxin®) may additionally carry:

- Localized muscle weakness (very rare)
  - Prolonged or excessive erection (priapism — rare, requires immediate medical care)
- 

## Consent

☒ I understand the purpose, benefits, risks, alternatives, and limitations of the P-Shot® and any selected add-ons (P-Shot® 100, Priapus Toxin®).

☒ I have had the opportunity to ask questions.

☒ I voluntarily consent to proceed with treatment.
