1. Download the rar file from the [download link](#) and extract it into your **versions** folder: **OpenGOAL Launcher > Settings > Versions > folder icon > [version]) with gk.exe and goalc.exe.**

2. Extract your Jak TPL iso: drag it into **extractor.exe** then close the game if it opens automatically.

3. If you do not already have your own **.env** file, or are fine with using the default settings and inputting your User Settings again, just remove **EXAMPLE** from the file provided (rename it to **.env** – make sure it's actually saved as an env file type). Then open **J1T_GUI** (or open the **.env** file, your choice) and change your **required User Settings:**
  - **OUATH:** Generate an ouath token [here](#).
  - **TARGET_CHANNEL:** Your Twitch channel name.
If you wish to change these from their default:
  - **PREFIX:** What character(s) to start your commands with (ex. #trip / !trip / ~trip)
  - **TARGET_ID:** Your name, for when there's multiple targets (chatters will use this to target you).
  - Plus many other settings!
  - When you're done, click **Save Settings.**
If you already have an **.env** file and don't want to use the default settings, open **J1T_GUI** and change the desired/empty fields, then save.

4. Open **Jak1Twitch.exe** and wait for the red eco, then you're good to go! Use the **#start** command in chat to start when you're ready (if you have **LOAD_STARTED** turned off).

Side Notes:
- When you close the game, make sure to close **Jak1Twitch.exe** too!
- If the bot doesn't connect when you open the program, just close and try again. If the problem persists, try generating a new oauth token or double check your settings in the **.env** file.
