Problem: I do not know how to go through my current website client project as quick as I can to get it out by Sunday

Brainstorming:

Constraints:

What would I do if I only had 1.5-2 hours to do this?
- Use chat gpt to revise every part of my HTML and PHP code and tell it to look over functionality
- I would sit down and create a captcha, and have ChatGPT insert that into my code
- I would copy and paste html code from a functioning contact form website online or through GitHub
- I would ask the client acquisition skills chat on how to configure backend code to send emails to my client after a customer has filled it out
- I would then ask ChatGPT to fill out the copy and pasted php code
- I will not play any music
- 20 pushups every 20 minutes as fast as I can
- Search in TheOdinProject how to securely setup file permissions

The Disney Process:

- Use ChatGPT 4 to revise php code because it works faster than I can. Say "I'm trying to get this submit button to only work if the user has submitted all the forms correctly and the email has been sent to this email address successfully, it will go to XYZ page once it does. If it doesn't work, keep going to the contact pages' html and a pop up that reads: error"
- Get a reCaptcha and use ChatGPT to install it into code because I don't have much time to figure out how to install it on my own. Log into an account if I have to and receive html code. Ask ChatGPT: "can you place this captcha above the text input, and make code so that the button will only submit the form if they have filled out the captcha correctly
- Copy and paste php from internet: search up GitHub or any other coding website with sample pages and copy and paste the php code from the website to my php file, accounting for the class.

Weaknesses: any ambiguity in my question to ChatGPT can potentially lead to misunderstanding and more time wasted

The php code from the internet may be faulty for my purposes as SMTP or POP3 may not work.risk of the code not being secure enough is there as I know little about cybersecurity in coding

Getting reCaptcha may be a complicated process as I don't know how much time it will take.

Why did I not graduate from the Agoge Program?
