Revisions to Analytic definitions

Need two final versions:

For POST, please make the following changes:

In Downloads, change to **60-seconds** or more. Change second reference of **24-hours** will count as one download.

For StoryMint version:

% Total change to For example, if you **produced three episodes** and they all had.....

POST

SHOW	All information and statistics shown are unique to the selected show(s). To change the show(s) displayed, use the "Select Shows" menu.
EPISODE	The information shown is broken down by episodes, allowing you to evaluate the performance of each show installment.
DOWNLOADS	This represents the total number of listens to an episode within the selected time period (based on UTC). A download is counted when a listener consumes 60-seconds or more of an episode (by streaming or downloading to a device) within a 24-hour period. Multiple playbacks of the same episode by a unique listener with 24-hours will count as one download.
% TOTAL	This information represents the percentage of the total number of downloads for the selected shows within the chosen reporting period. For example, if you selected three shows and they all had the same number of downloads during the reporting period, each show would display a 33.3% Total.
UNIQUE USERS	This information represents the number of unique listeners determined by a combination of User-Agent (e.g. browser or app used to play content) and IP Address within a 24-hour period. (Based on UTC)
LTR	Listen-Through Rate is the average percentage of a show and/or episodes' total duration that listeners have consumed during the selected time period. The metric is reflective only of episodes streamed and not those downloaded to devices.

	Note: This is an experimental metric and does not impact (IAB) guidelines.
COUNTRY	Represents the listeners' country of origin.

StoryMint

All information and statistics shown are unique to the selected show(s). To change the show(s) displayed, use the "Select Shows" menu. The information shown is broken down by episodes, allowing you to evaluate the performance of each show installment. DOWNLOADS This represents the total number of listens to an episode within the selected time period (based on UTC). A download is counted when a listener consumes 60-seconds or more of an episode (by streaming or downloading to a device) within a 24-hour period. Multiple playbacks of the same episode by a unique listener with 24-hours will count as one download. This information represents the percentage of the total number of downloads for the selected shows within the chosen reporting period. For example, if you produced three shows and they all had the same number of downloads during the reporting period, each show would display a 33.3% Total. UNIQUE USERS This information represents the number of unique listeners determined by a combination of User-Agent (e.g. browser or app used to play content) and IP Address within a 24-hour period. (Based on UTC) LITR Listen-Through Rate is the average percentage of a show and/or episodes' total duration that listeners have consumed during the selected time period. The metric is reflective only of episodes streamed and not those downloaded to devices. Note: This is an experimental metric and does not impact (IAB) guidelines. COUNTRY Represents the listeners' country of origin.
