EFFLUENT MANAGEMENT PLAN

Animal effluent and solid animal waste is managed to <u>minimise nutrient leaching and run-off</u>

Property Name: Maerewhenua Investments ltd	
Supplier number: 36749	
Person responsible for implementing this plan: Grant Tremewan	
Date: 10/12/23	
Contacts for breakdowns and maintenance:	pics
o Waterforce Oamaru	
o Calect Electrical	

Target 1: Compliance	Evidence if	
	applicable	
Fonterra Farm Dairy Inspections Enviroment Canterbury inspections	o Ecan inspections o Supplier inspections	

Target 2: Storage Management	Evidence if applicable	
Storage system and design		
The system features gravity feed from the shed, through a sump, into an anaerobic pond. It is then siphoned into an aerobic pond. When conditions allow zero solids effluent is spread on the paddocks via Pivot 1. The pump automatically shuts off the pump if loss of pressure or flow occurs. The pivots have backflow preventers. The dairy shed makes use of recycled cooler water for wash down to minimise effluent quantity, and has a closed loop chilled water cooling system. Nozzles in the shed are operated at the lowest pressure and flow at which they can be effective.	• site inspection	
Storage Management		
It is our policy to apply stored effluent at the earliest opportunity allowed by the soil moisture conditions so that the storage pond is at the lowest possible level at any given time to prepare for extended periods of high soil moisture which excludes pasture application.	o Site inspection	

Target 3: Application	Evidence if applicable
Application Area	Evidence/records
The application area is 35ha, through pivot 1.	Maps Nutrient Budget
Application Depth 5.8mm of diluted effluent with irrigation water	

 Effluent capable pivot application rates from bucket testing. 	Bucket Tests
o Pivot one. 5.8mm	
Operations and Maintenance	
All maintenance is recorded in the irrigation maintenance register	Application map
Operations are described in the Effluent SOPs	
A recording that the pump is in good operational order is inside the switchboard at	
the pump shed.	
Environmental and Health and Safety Risks	
- Overview of farm risks – environmental and health and safety	
Paddocks 1-6 can cause runoff and run rough be towned off	
o end gun must be turned off	
 30% min speed is 7mm application low pressure cutout must be active 	
o low pressure cutout must be active	
Proof of placement	
Effluent application is recorded on irrigation google doc	
2 Indent application is recorded on impation google doc	
Operations	

Evidence/records

Daily

Maintenance Daily O Check pond level Check pump is running correctly Monthly Check stone traps and empty Annually Train staff on operation and maintenance of system Bucket tests Drop test Spread solids Soil test effluent block Incident procedures What to do when: Saturated soils - pump to storage Storage issues - prevent by keeping pond at lowest possible level prior to any rain events. Hydrant or pipe leaking - turn off effluent, report on group message and fix immediately.	0 0 0 Start-	RecordsEffluentapplication map
