

Tipuri de date abstracte (TDA)

- daca vrem sa scriem un cod corect, trebuie sa stim si modul in care sunt implementate structurile de date folosite
- List (ArrayList, LinkedList): cum ne dam seama ca insert, get sau alte operatii sunt corecte?
- inainte de a implementa o structura de date, vom defini cateva axiome ce trebuie sa fie indeplinite de oricare implementarea structurii respective de date
- ce face insert si ce face get, orice implementare de get si insert va face ceea ce ne dorim/ se va comporta corect

Ce contine un TDA ?

1. CONSTRUCTORI - arata din ce este format ADT-ul nostru

Ex: Lista cu elemente de tip E => avem nevoie de:

a) o metoda de a avea o lista goala

empty : → List

b) o metoda de a crea o lista prin adaugarea unui element

cons : E x List → List

$[] = \text{empty}$

$[4] = \text{cons}(4, \text{empty})$

$[1, 2, 3, 4] = \text{cons}(1, \text{cons}(2, \text{cons}(3, \text{cons}(4, \text{empty})))) = 1 : 2 : 3 : 4 : []$

Notatie: $\text{cons}(a, b) \Leftrightarrow a : b$

2. OPERATORI - operatii/functionalitati realizate pe baza TDA-ului

Ex: pentru List: reverse, concat, isempty, head, tail

$\text{head}([1, 2, 3, 4]) = 1$

$\text{tail}([1, 2, 3, 4]) = [2, 3, 4]$

3. AXIOME - cum se realizeaza operatiile → set de reguli care descriu comportamentul unui operator, fara a il implementa

In multe cazuri, veti vedea la PP ca implementarea unui operator se face aproape identic cu axioma, in mult cazuri, in limbaje functionale precum Haskell si Scala.

Axiomele si proprietatile operatorilor (propozitii logice derive din axiome) sunt identice dpd sintactic (ambele sunt propozitii logice) si le putem folosi in alte axiome.

Constructori

- TDA-urile au 3 tipuri de constructorii
- Presupune ca am definit un TDA numit T cu elemente de tip E:
 1. **CONSTRUCTORI NULARI** → nu primesc date de intrare/parametri $C_n : \rightarrow T$
Ex: empty
 2. **CONSTRUCTORI EXTERNI** → primesc date din exterior care nu sunt de tipul TDA-ului definit $C_e : E \rightarrow T$ $C_e : E \times E \times E \rightarrow T$
Ex: Leaf : E → Tree

3. **CONSTRUCTORI INTERNI** → primesc cel putin un paramteru de tipul TDA-ului construit

$C_i : \dots \times T \times \dots \rightarrow T$

Ex: $\text{cons} : E \times \text{List} \rightarrow \text{List}$

Ce este o axioma?

- o propozitie logica adevarata, care descrie corect ce vrem sa faca operatorul
- axiomele trebuie sa fie SUFICIENTE, adica sa ia in considerare toate formele pe care le poate lua un TDA (avem nevoie de axiome pentru situatia in care lista este empty, dar si cand este $\text{cons}(e, l)$)
 - $\text{isempty}(\text{empty}) = \text{True}$
 - $\text{isempty}(\text{cons}(e, l)) = \text{False}$
- ideal e sa folosim constructorii de baza ai unui ADT, nu alti operatori cand definim un set de axiome, dar nu e mereu necesar
 - $\text{reverse}(\text{reverse}(\text{list})) = \text{list}$
- Este o axioma inutila deoarece nu ofera informatii despre functionalitatea operatorului revers, insa poate fi folosita ca proprietate
- pe baza axiomelor putem sa obtinem proprietati ale operatorilor.
 - $\text{reverse}(\text{reverse}(\text{list})) = \text{list}$
- pentru a folosi o proprietate, ea trebuie demonstrata

Ex: axiome pentru operatorul ce exprima lungimea unei liste

$\text{length} : \text{List} \rightarrow \text{Integer}$

$\text{length}(\text{empty}) = 0$

$\text{length}(\text{cons}(x, xs)) = 1 + \text{length}(xs)$

Exercitii

1. Definiți axiome pentru următorii operatori pe tipul List:

- append (concatenarea unei liste la o alta; $\text{append}(\text{cons}(8, \text{cons}(12, \text{empty})), \text{cons}(3, \text{cons}(6, \text{empty}))) = \text{cons}(8, \text{cons}(12, \text{cons}(3, \text{cons}(6, \text{empty}))))$)
- reverse (inversează elementele dintr-o listă)

Axiome pentru append:

Append primește 2 liste.

Vom defini axiomele acestui operator in functie de toti constructorii uneia dintre acestea.

$\text{append}(\text{empty}, l) = l$

$\text{append}(\text{cons}(e, l_1), l_2) = \text{cons}(e, \text{append}(l_1, l_2))$

Axiome pentru reverse:

$\text{reverse } \text{empty} = \text{empty} \qquad \Leftrightarrow \text{reverse } [] = []$

$\text{reverse } \text{cons}(e, l) = \text{reverse}_2(\text{empty}, \text{cons}(e, l)) \Leftrightarrow \text{reverse } e:l = \text{reverse}_2([], e:l)$

Unde definim axiome pentru operatorul auxiliar reverse_2 :

$\text{reverse}_2(l_2, \text{cons}(e, l_1)) = \text{reverse}_2(\text{cons}(e, l_2), l_1)$

$\text{reverse}_2(l_2, \text{empty}) = l_2$

In lista l_2 se construiesc inversul, pana se consuma lista din dreapta:

l_2 lista initiala

$[] 1:2:3:4:[]$

```

1:[]    2:3:4:[]  

2:1:[]    3:4:[]  

3:2:1:[]    4:[]  

4:3:2:1:[]    []

```

2. Definiți axiome pentru următorii operatori pe tipul `BTree`:

- `mirror : BTree → BTree` (arborele oglindit pe verticală, i.e. pentru orice nod, copilul stâng devine copilul drept și vice-versa)
- `flatten : BTree → List` (lista cu toate elementele din arbore; observați că există mai multe ordini posibile)

tree	height	mirror	
5	1	5	Intai trebuie sa definim cine este TDA-ul Btree:
/ \		/ \	
6 8	2	8 6	emptyTree : → BTree [nular]
/ \ \		/ / \	Node : Integer x BTree x BTree → BTree [intern]
9 10 0	3	0 10 9	

`Node(5,`

`Node(6, Node(9, emptyTree, emptyTree), Node(10, emptyTree, emptyTree)),
Node(8, emptyTree, Node(0, emptyTree, emptyTree))`

`)`

Apoi definim axiome pentru operatori pe baza constructorilor acestui TDA.

`size : BTree → Integer`

`size(emptyTree) = 0`

`size(Node(e, s, d)) = 1 + size(s) + size(d)`

Observatie: regulile/axiomele cele mai generale se pun mai jos, sus se pun cele mai particulare

`height : BTree -> Integer`

`height emptyTree = 0`

`height Node(e, s, d) = max(height(s), height(d)) + 1`

Observatie: Orice operator introdus trebuie să fie definit, DAR considerăm ca funcțiile matematice deja sunt definite.

`mirror : BTree → BTree`

`mirror(emptyTree) = emptyTree`

`mirror(Node(e, s, d)) = Node(e, mirror(d), mirror(s))`

`flatten : BTree → List`

`flatten(emptyTree) = []` ← am folosit scrierea prescurtată pentru cons și empty

`flatten(Node(e, s, d)) = e:[] ++ flatten(s) ++ flatten(d)`

← aici ar mai fi nevoie să aratăm că operatorul de concatenare este asociativ

`(e:[] ++ flatten(s)) ++ flatten(d) = e:[] ++ (flatten(s) ++ flatten(d))` [facut mai jos, la ex. 3]

Vom introduce un operator nou: `++ / concat`

Notatie: `concat (l1, l2) = l1 ++ l2`

$\text{concat} : \text{List} \times \text{List} \rightarrow \text{List}$ \leftarrow vom nota prescurtat concat cu ++

 $\text{concat}(\text{empty}, l) = l$

 $\text{concat}(e:l_1, l_2) = e : \text{concat}(l_1, l_2)$

Ex: $\text{concat}(1:2:3:[], 4:5:[]) = 1:\text{concat}(2:3:[], 4:5:[])) =$
 $= 1:2:\text{concat}(3:[], 4:5:[])) = 1:2:3:\text{concat}([], 4:5:[])) = 1:2:3:4:5:[]$

3. Definiți axiome pentru următorii operatori pe tipul `Map`:

- `update : Map × K × V → Map` (un Map cu o nouă asociere cheie:element)
- `delete : Map × K → Map` (șterge cheia și valoarea asociată)

Vom defini TDA-ul Map cu valori de tip `V` și chei de tip `E`:

```
{
    // chei : valori
    x : 45
    y : 99
    z : 734568
}
<=> entry(x, 45, entry(y, 99, entry(z, ..., noEntry)))
```

Pas 1: definim constructorii

<code>noEntry : → Map</code>	<code>[nular]</code>
<code>entry : E × V × Map → Map</code>	<code>[intern]</code>

Pas 2: definim axiome pentru operatori

<code>get : E × Map \ {noEntry} → V</code>	
<code>get(k, entry(k, v, m)) = v</code>	
<code>get(k, entry(c, v, m)) = get(k, m)</code>	<code>(c ≠ k)</code>

<code>exists : E × Map → Bool</code>	
<code>exists(k, noEntry) = False</code>	
<code>exists(k, entry(k, v, m)) = True</code>	
<code>exists(k, entry(c, v, m)) = exists(k, m)</code>	<code>(c ≠ k)</code>

<code>update : E × V × Map → Map</code>	
<code>update(k, w, noEntry) = entry(k, w, noEntry)</code>	
<code>update(k, w, entry(K, v, m)) = entry(k, w, m)</code>	
<code>update(k, w, entry(c, v, m)) = entry(c, v, update(k, w, m))</code>	

ex: $\text{update}(1, 'a', \text{entry}(2, 'b', \text{entry}(3, 'd', \text{entry}(1, 'd', \text{noEntry})))) =$
 $= \text{entry}(2, 'b', \text{update}(1, 'a', \text{entry}(3, 'd', \text{entry}(1, 'd', \text{noEntry})))) =$
 $= \text{entry}(2, 'b', \text{entry}(3, 'd', \text{update}(1, 'a', \text{entry}(1, 'd', \text{noEntry})))) =$
 $= \text{entry}(2, 'b', \text{entry}(3, 'd', \text{entry}(1, 'a', \text{noEntry})))$

<code>delete : E × Map → Map</code>	
<code>delete(k, noEntry) = noEntry</code>	
<code>delete(k, entry(k, v, m)) = m</code>	
<code>delete(k, entry(c, v, m)) = entry(c, v, delete(k, m))</code>	

Inductia structurala

- folosita pentru a demonstra proprietati ale TDA-urilor ce deriva din axiome
- **CAZ DE BAZA**
 - aratam ca proprietatea tine pentru constructorii NULARI si EXTERNI
- **IPOTEZA DE INDUCTIE**
 - ce avem de demonstrat
- **PAS DE INDUCTIE**
 - aratam ca relatia din ipoteza de inductie ramane adevarata si cand folosim oricare din constructorii sai INTERNI

Exercitii:

4. Demonstrați următoarele propoziții, folosind inducție structurală:

a) $\forall t \in \text{BTree} \Rightarrow \text{size}(t) = \text{size}(\text{mirror}(t))$

CB: aplicat doar pentru constructorii nulari (si externi)

$$\text{size}(\text{emptyTree}) = 0$$

$$\text{size}(\text{mirror}(\text{emptyTree})) = \text{size}(\text{emptyTree}) = 0$$

=> OK

II: Pp. ca $\text{size}(t) = \text{size}(\text{mirror}(t))$ este adevarata pentru orice lista

PI: Demonstram ca II tine pentru orice constructor intern. Adica vrem sa demonstram:

$$\text{size}(\text{Node}(e, s, d)) = \text{size}(\text{mirror}(\text{Node}(e, s, d)))$$

$$\text{size}(\text{Node}(e, s, d)) = 1 + \text{size}(s) + \text{size}(d)$$

$$\text{size}(\text{mirror}(\text{Node}(e, s, d))) = \text{size}(\text{Node}(e, \text{mirror}(d), \text{mirror}(s))) =$$

$$= 1 + \text{size}(\text{mirror}(s)) + \text{size}(\text{mirror}(d)) = [\text{conform II}]$$

$$= 1 + \text{size}(s) + \text{size}(d)$$

=> Inductie OK

b) $\forall t \in \text{BTree} \Rightarrow \text{size}(t) = \text{length}(\text{flatten}(t))$

CB:

$$\text{size}(\text{emptyTree}) = 0$$

$$\text{length}(\text{flatten}(\text{emptyTree})) = \text{length}(\text{empty}) = 0$$

II:

$$\text{size}(t) = \text{length}(\text{flatten}(t))$$

PI: Aratam ca: $\text{size}(\text{Node}(e, s, d)) = \text{length}(\text{flatten}(\text{Node}(e, s, d)))$

$$\text{size}(\text{Node}(e, s, d)) = 1 + \text{size}(s) + \text{size}(d)$$

$$\text{length}(\text{flatten}(\text{Node}(e, s, d))) =$$

$$= \text{length}(\text{append}(\text{append}(\text{cons}(e, \text{empty}), \text{flatten}(s)), \text{flatten}(d)))$$

$$= \dots = [\text{vezi mai jos}] = 1 + \text{size}(s) + \text{size}(d)$$

Aici avem de aratat o proprietate in plus, adica

$$\text{length}(\text{append}(a, b)) = \text{length}(a) + \text{length}(b) \quad \forall a, b \in \text{List}$$

CB:

$$\text{length}(\text{append}(\text{empty}, l)) = \text{length}(l)$$

$$\text{length}(l) + \text{length}(\text{empty}) = \text{length}(l) + 0 = \text{length}(l)$$

II:

$$\text{length}(\text{append}(a, b)) = \text{length}(a) + \text{length}(b)$$

PI:

$$\text{length}(\text{append}(\text{cons}(x, l_1), l_2)) = \text{length}(\text{cons}(x, \text{append}(l_1, l_2))) =$$

$$\begin{aligned}
&= 1 + \text{length}(\text{append}(l_1, l_2)) = 1 + \text{length}(a) + \text{length}(b) \\
\text{length}(\text{cons}(x, l_1)) + \text{length}(l_2) &= 1 + \text{length}(l_1) + \text{length}(l_2) \\
\Rightarrow \text{Inductie OK}
\end{aligned}$$

Revenim la ce aveam inainte:

$$\begin{aligned}
\text{length}(\text{flatten}(\text{Node}(e, s, d))) &= \\
&= \text{length}(\text{append}(\text{append}(\text{cons}(e, \text{empty}), \text{flatten}(s))), \text{flatten}(d)) \\
&= \text{length}(\text{append}(\text{cons}(e, \text{empty}), \text{flatten}(s))) + \text{length}(\text{flatten}(d)) = \\
&= \text{length}(\text{cons}(e, \text{empty})) + \text{length}(\text{flatten}(s)) + \text{length}(\text{flatten}(d)) = \\
&= 1 + \text{length}(\text{empty}) + \text{length}(\text{flatten}(s)) + \text{length}(\text{flatten}(d)) = \\
&= 1 + 0 + \text{length}(\text{flatten}(s)) + \text{length}(\text{flatten}(d)) = \\
&= 1 + \text{length}(\text{flatten}(s)) + \text{length}(\text{flatten}(d)) = \\
&= 1 + \text{size}(s) + \text{size}(d)
\end{aligned}$$

\Rightarrow Inductie OK

- c) $\forall l \in \text{List} \Rightarrow \text{append}(l, \text{empty}) = l$

CB:

$$\begin{aligned}
l &= \text{empty} \\
\text{append}(\text{empty}, \text{empty}) &= \text{empty}
\end{aligned}$$

II:

$$\text{append}(l, \text{empty}) = l$$

PI:

$$l = \text{cons}(x, xs)$$

Demonstram ca

$$\begin{aligned}
\text{append}(\text{cons}(x, xs), \text{empty}) &= \text{cons}(x, xs) \\
\text{append}(\text{cons}(x, xs), \text{empty}) &= \text{cons}(x, \text{append}(xs, \text{empty})) = \text{cons}(x, xs)
\end{aligned}$$

\Rightarrow Inductie OK

- d) $\forall l_1, l_2, l_3 \in \text{List} \Rightarrow \text{append}(l_1, \text{append}(l_2, l_3)) = \text{append}(\text{append}(l_1, l_2), l_3)$
adica: $l_1 ++ (l_2 ++ l_3) = (l_1 ++ l_2) ++ l_3$

CB:

$$\begin{aligned}
l_1 &= \text{empty} \\
\text{empty} ++ (l_2 ++ l_3) &= l_2 ++ l_3 \\
(\text{empty} ++ l_2) ++ l_3 &= l_2 ++ l_3
\end{aligned}$$

II:

$$l_1 ++ (l_2 ++ l_3) = (l_1 ++ l_2) ++ l_3$$

PI: demontram ca:

$$\begin{aligned}
\text{cons}(x, l_1) ++ (l_2 ++ l_3) &= (\text{cons}(x, l_1) ++ l_2) ++ l_3 \\
\text{cons}(x, l_1) ++ (l_2 ++ l_3) &= \text{cons}(x, l_1 ++ (l_2 ++ l_3)) \\
&= (\text{cons}(x, l_1) ++ l_2) ++ l_3 = \text{cons}(x, l_1 ++ l_2) ++ l_3 = \\
&= \text{cons}(x, (l_1 ++ l_2) ++ l_3) = \text{cons}(x, l_1 ++ (l_2 ++ l_3))
\end{aligned}$$

\Rightarrow Inductie OK

- e) $\forall l_1, l_2 \in \text{List} \Rightarrow \text{length}(\text{append}(l_1, l_2)) = \text{length}(\text{append}(l_2, l_1))$

CB:

$$\begin{aligned}
\text{length}(\text{append}(\text{empty}, l_2)) &= \text{length}(l_2) \\
\text{length}(\text{append}(l_2, \text{empty})) &= \text{length}(l_2) \text{ deja anterior demonstrat}
\end{aligned}$$

II:

$$\text{length}(\text{append}(l_1, l_2)) = \text{length}(\text{append}(l_2, l_1))$$

PI: demontram ca:

$$\begin{aligned}
& \text{length}(\text{append}(\text{cons}(x, l_1), l_2)) = \text{length}(\text{append}(l_2, \text{cons}(x, l_1))) \\
& \text{length}(\text{append}(\text{cons}(x, l_1), l_2)) = \\
& = \text{length}(\text{cons}(x, \text{append}(l_1, l_2))) = \\
& = 1 + \text{length}(\text{append}(l_1, l_2)) = \\
& = 1 + \text{length}(l_1) + \text{length}(l_2) \\
& \text{length}(\text{append}(l_2, \text{cons}(x, l_1))) = \\
& = \text{length}(l_2) + \text{length}(\text{cons}(x, l_1)) = \\
& = \text{length}(l_2) + 1 + \text{length}(l_1) = \\
& = 1 + \text{length}(l_1) + \text{length}(l_2)
\end{aligned}$$

=> Inductie OK

f) $\forall l_1, l_2 \in \text{List} \rightarrow \text{reverse}(\text{append}(l_1, l_2)) = \text{append}(\text{reverse}(l_2), \text{reverse}(l_1))$

CB:

$$\begin{aligned}
& \text{reverse}(\text{append}(\text{empty}, l_2)) = \text{reverse}(l_2) \\
& \text{append}(\text{reverse}(l_2), \text{reverse}(\text{empty})) = \\
& = \text{append}(\text{reverse}(l_2), \text{empty}) = \text{reverse}(l_2)
\end{aligned}$$

II:

$$\text{reverse}(\text{append}(l_1, l_2)) = \text{append}(\text{reverse}(l_2), \text{reverse}(l_1))$$

PI: Demonstram ca:

$$\begin{aligned}
& \text{reverse}(\text{append}(\text{cons}(x, l_1), l_2)) = \\
& = \text{append}(\text{reverse}(l_2), \text{reverse}(\text{cons}(x, l_1))) \\
& \text{reverse}(\text{append}(\text{cons}(x, l_1), l_2)) = \\
& = \text{reverse}(\text{cons}(x, \text{append}(l_1, l_2))) \\
& = \text{append}(\text{reverse}(\text{append}(l_1, l_2)), \text{cons}(x, \text{empty})) = \\
& = \text{append}(\text{append}(\text{reverse}(l_2), \text{reverse}(l_1)), \text{cons}(x, \text{empty})) = \\
& = (\text{reverse}(l_2) ++ \text{reverse}(l_1)) ++ \text{cons}(x, \text{empty}) \\
& \text{append}(\text{reverse}(l_2), \text{reverse}(\text{cons}(x, l_1))) = \\
& = \text{reverse}(l_2) ++ \text{reverse}(\text{cons}(x, l_1)) = \\
& = \text{reverse}(l_2) ++ (\text{reverse}(l_1) ++ \text{cons}(x, \text{empty})) = \\
& = (\text{reverse}(l_2) ++ \text{reverse}(l_1)) ++ \text{cons}(x, \text{empty})
\end{aligned}$$

=> Inductie OK
