Jax.Network To Implement Copyleft Policy For Token Growth

[Jax.Network](#) has proven to be one of the best blockchain networks currently in operation, only comparable to the likes of the Bitcoin network to which it is linked. Jax.Network is steered by progressive minds that believe in absolute success when it comes to serving the world the best blockchain-based products – be it stablecoins like the native Jax or crypto wallets like the PeaceWallet.

Besides that, Jax.Network has earned recognition as being among the very few development teams willing to share their findings and development process under a copyleft policy with the rest of the world. This is particularly notable considering that most other blockchain developers view the industry as highly competitive and seek to keep their innovations under wrap. Jax.Network is strongly inclined to serve all humanity.

Token Growth

As mentioned, the network has its own native stablecoin known as JAX. JAX enables you (the user) to keep your crypto stash intact in times of price volatility. The network has been working on making Jax mainstream, and being selfless in its quest to spur blockchain-oriented innovations is one way to do that.

One notable feature on the Jax.Network is the zero fees charged when you transact with JAX (the stablecoin). This, coupled with the network's support for Bitcoin and JXN, has positively impacted the growth of the JAX token.

Knowledge Sharing

"In the past decades, private companies built by friends and family dominated the global economy. As part of the blockchain revolution where we can achieve decentralized trust, talent from around the world should be able to collaborate and deliver value. To set an example, Jax.Network will run its blockchain's communities and companies in a way where we promote knowledge sharing with the edge shifted from trade-secrets and monopolistic limitations to focus and speed.", Vinod Manoharan, founder and CEO of Jax.Network.

To that effect, Jax.Network gives all interested parties free access to its [code repository](#) on GitLab. Anyone is free to check, re-use or modify the code in their own innovative ways. That's how a community grows.
