My name is Sai Subhasree Raghavan, and I am speaking today on behalf of the Health ImPACT Coalition, which consists of over 300 health civil society and affected community advocates.

We acknowledge that key points raised in our written inputs are reflected in the provisions in the Rev. 1 Pact, and we thank you for the strong emphasis on language to protect and promote human rights, gender equality, and equitable access to sustainable development and commensurate financing for low- and middle-income countries (LMICs), to address and mitigate the interlinked causes and adverse impacts of climate change, biodiversity loss, pollution, water scarcity However, we are concerned that some critical components are missing.

Health is a key driver of the SDG Agenda's success, but it is not fully integrated into the Pact for the Future, the Global Digital Compact, or the Declaration of Future Generations.

We urge you to recognize that achieving health rights is required for the fulfillment of all other human rights, to emphasize financially and environmentally sustainable and resilient health and nutrition as an intersectional issue, and to address gender equity in all of its forms, including gender-responsive healthcare and the protection of sexual and reproductive health and rights.

We want you to commit to:

- Accelerating progress toward fulfilling commitments made at the high level Universal Health Coverage meeting, including disease-prevention policies and regulations.
- Increasing global, regional, and domestic investments to strengthen health and community health systems and build a competent, resilient and sufficient healthcare workforce.
- Equal and meaningful engagement of civil society and affected communities, including vulnerable, marginalized and criminalized individuals, in governance, accountability and leadership.
- Strengthening stewardship of an integrated and unifying One Health approach that seeks to sustainably balance and optimize the health of people, animals, and ecosystems.
- Implementing adequate health data management policies (including AI) that prioritize and protect data security, privacy, accuracy, and integrity.
- Ensuring intellectual property is managed in order to avoid exclusivities and market monopolies, encourage low prices through generic competition, and maximize open sharing of scientific research, discovery, innovation, and know-how within and across countries.
- Ensuring that the Pact of the Future is based on mechanisms that promote transparent information sharing, inclusive processes for all stakeholders, independent review and evaluation, and accountability frameworks with public reporting.
