Image Reflection

Image: Medication Calculations Suck

Author: Lauren Dolgner

In my role, I frequently work with Diploma of Nursing students who have lost confidence in their ability to perform medication calculations. Many of these students are frustrated, doubt their capabilities, and begin to question whether they can successfully complete their qualification. My role is to support them in developing both the numeracy skills and the self-belief needed to achieve competency.

For many students, the turning point comes when they realise they are not facing these challenges alone and that support is available through the Academic Learning Centre. As students engage with our services and begin to experience academic success, their confidence gradually grows. Feelings of anxiety and hopelessness are replaced by optimism, resilience, and a renewed belief in their ability to succeed.

This image depicts that metamorphosis, illustrating the movement from darkness and uncertainty towards hope, confidence, and the possibility of future success.
