

All of our devices are centrally managed. And there are a couple of reasons for that. The first one is that as a school, we didn't really have the technical capacity to manage them independently. So all of our iPads are centrally managed. But there are lots of things about that which makes that a really important part to how we work.

So the first thing is that all of the people have a managed Apple ID. Through that they have a limited access to certain things. For example, there's no App Store. The children can download apps from an app called self Service in our case. But they're all apps that are either pre approved or have been purchased by the school.

So that automatically means that devices are all very similar. It automatically means that children can't download apps or content that they shouldn't have access to. For us, one of the biggest benefits of having a centrally managed iPad model is that things like updates are all taken care of.

So as long as we ensure that all of the iPads are plugged in on a particular Friday afternoon, they will update over the weekend. And again, that's the kind of thing that with the scale and size of our deployment, if we didn't have that managed iPad model, we would probably really struggle and have lots of time spent on things the way that things are set up, that's it's just not the case for us.
