What are the benefits of LASIK vs ICL

LASIK Benefits

LASIK offers a fast treatment that normally takes just minutes per eye. The recovery time is also fast, and with improved visual perception, you can get back to your normal routine in a day or two. LASIK has a long history of great results, and the majority of patients achieve better than 20/20 vision. In addition, LASIK procedures often result in reduced glare and better night vision than with glasses or contact lenses.

ICL Benefits

With EVO Visian ICL, the surgeons at ClearSight are able to treat levels of nearsightedness that far exceed the limits of LASIK. The visual outcomes have been shown in several studies to be as good as or better than LASIK for high prescriptions. ICL surgery is quick, virtually painless, and the results are immediate. If your prescription should change or other vision needs arise, the artificial lens can be removed.

What are the main differences between ICLs and LASIK?

LASIK and Visian ICLs can both treat diverse populations despite having similar criteria. Here are some key distinctions between the two choices.

LASIK can address a wider range of refractive errors, whereas Visian ICLs are only approved to treat nearsightedness.

Visian ICLs are not a recommended treatment for patients above the age of 45. Although getting LASIK is not advised for older people either, many middle-aged people in their 40s and 50s do so without any issues, however, in some cases, reading glasses will be a requirement for LASIK in this age range.

For those who have thin corneas, keratoconus (a bump on the cornea that resembles a cone), or persistent dry eyes, Visian ICLs are an excellent option. LASIK can exacerbate dry eye, and it is not advised for anyone with any other eye issue, including naturally thin corneas.

LASIK removes corneal tissue, whereas Visian ICLs do not.

If required, ICLs can be removed. LASIK is not reversible. In order to remedy overcorrections from LASIK, a different kind of laser-guided eye procedure with a lengthier recovery period would be needed.

Visian ICLs can provide UV protection, which helps lessen damage to the eye's internal structures. This sort of UV protection is not available with LASIK.

According to accounts from Visian ICL recipients, roughly 81 percent had vision that was at least 20/40 after the treatment, with 20/20 vision being attained by 41% of patients. 99.5 percent of LASIK patients claim 20/40 visual acuity or better, and 90.8% have 20/20 vision.

Company Description

With decades of combined expertise, our team of board certified vision correction surgeons and highly skilled medical staff are dedicated to making sure your experience with us is comfortable, enjoyable, and most importantly, life-changing!
