

V-Ultra 3

V-Ultra is the latest Volatronix trading system that guarantees the unbiased growth of cryptocurrency. It works. Everyone who uses it knows it works. Go to bookmark [proof that this works](#) below to see actual results on a bunch of markets. Following the prompts in the program should be easy enough to get set up, but if not this manual will help. You can check out the [YouTube Playlist](#) for this manual if you don't like reading or want me to read it along with you. You can [download](#) the program and explore it right now.

Features:

1. Choose from over 100 exchanges to trade on
2. Volatility ranking and sorting
3. Backtesting
4. Allocation management tools
5. Parameters
6. Single run or continuous trading
7. Pay for trade time with ETH or BNB or KCS
8. Several Report options
 - Full growth reports for all markets
 - Average unbiased growth of all markets
 - Forecasting on expected growth at a hundred, a thousand, and ten thousand trades
 - Volatronix versus what HODL would be worth since start
9. Liquidation of single market or entire account from coin to quote currency
10. Wallet balance checking and synchronizing with allocations
11. Market list options, comma separated list prints
12. Market info (for investigating data of any market)

The process is simple.

1. Pick a trading exchange supported by the bot
2. Decide how much to invest
3. V-Score the markets with the quote currency you'll be trading against coins (usually usd, usdt, btc, etc)
4. Backtest markets if you want to be confident they are more profitable than others
5. Choose the top X number of high volatility markets given
6. Divide that investment by the number of markets, X, you think you can trade (recommend \$100+/market on most exchanges, and \$40/market on KuCoin)
7. Set up allocations in the bot with that market list, spending ½ the investment per market on each coin
8. Set trading parameters.
9. Run the trader!

The program can be copied to different directories and used to trade on as many exchanges as you like.

V-Ultra tested and proven to work on these exchanges so far (feel free to test any of the other 120+):

[CoinbasePro](#)

[Binance-US](#)

[FTX-US](#)

[KuCoin](#)

Manual

1. After you [download](#) the file and unzip it you are met with a simple executable V-Ultra.exe - this version works on Windows 10 and 11
2. Open the program and immediately the files and files/reports directories are created

```
V-Version 2.1.1.1

Created files directory

Created reports directory

There are over 120 exchanges this software can trade on, each with a unique id.
To see a list of all of them, just hit <enter>.
(enter <x> to exit
Or just type in the exchange now, (ie: coinbasepro or binanceus)
:
```

See a list of exchanges if you just press <enter>

3. I'll continue with entering [kucoin](#)
Note that every exchange supported has an API section on their website for users to connect trading robots to.

Whatever your exchange is, you must **allow permissions “view” and “trade”**, but **do not allow “withdrawal” or “transfer”** on this API keyset for obvious reasons (you don't want someone to steal your money!) Labels on these permissions may vary between platforms

Entering the API public key, private key, and passphrase (if needed! KuCoin and Coinbase need passphrase) is saved in credentials.json so the robot can connect to the exchange and trade for you.

The email is optional. The bot will **try** to email you a growth report for the market just traded after every trade. However, after setting up high frequency trading, apparently voilacookie@gmail.com (the email bot sends from) has a **quota** and when reached it fails to send emails. I may come up with another messaging/notification solution.

I highly recommend trading with [KuCoin](#) for the following reasons:

1. Smallest minimum trade sizes I've EVER seen, for example some trades with a value 1/10th of a cent!
2. Over 500 coins to trade against USDT
2. Very low fees, the highest fees are 0.1%, that's one tenth of one percent of the trade size.
3. KYC- “know your customer” is not required for spot trading. (margin / leveraged trading requires it)

```
Or just type in the exchange now, (ie: coinbasepro or binanceus)
: kucoin

Set up API keys on your exchange making sure permissions like View and Trade are allowed, but NOT Withdraw or Transfer, then input them here...
Enter your Public API Key: 61b1 [REDACTED]
Enter your Secret API Key: 87ef08 [REDACTED]
Most exchanges do not require the additional password, however CoinbasePro does.
Type or leave blank if none just <enter>: 97a [REDACTED]
You can have the robot email you after every trade with a growth report for that market.
If you want emails enter it here: jax [REDACTED]@ua

Created credentials.json in files directory
Loading Exchange...

Created allocations.json in files directory

Created settings.json in files directory
```

Now the files directory is populated with 3 data files.

The credentials.json file is complete.

The allocations.json file template is set, with no market or allocation data yet

The settings.json file is created with default parameters, which can be changed in bot menu

4. If you followed instructions properly, you're here now! Main Menu...

```
Volatronix Ultra
Welcome Rebel!

-----Main Menu-----
1. V-Score
2. Backtest
3. Allocations
4. Parameters
5. Pay/Register
6. Run Trader
7. Reports
8. Tools
<X> Close program

----->:
```

Menu Structure

Main Menu 1: V-Score

```
-----V-Score Menu-----
1. Get volatility score of one market
2. Get ranked volatility list of all markets on exchange
3. Get ranked volatility list of all markets on quote currency
4. Get ranked volatility list of markets on quote currency which are not yet being traded
5. Get ranked volatility list from a custom, comma separated list of markets you input
<X> Go Back
----->:
```

On first time setup, you should use number 3 with your quote currency, on KuCoin, likely USDT

V3.0 - VolumeFilter will apply to # 3 and 4 if set to true

Main Menu 2: Backtest

```
-----Backtest Menu-----
1. Backtest with one trade max per day
2. Backtest on 4 control prices - OHLC (very inaccurate!)
3. Backtest on continuous prices, simulated between OHLC control points (fairly accurate)
<X> Go Back
----->:
```

I recommend backtesting on continuous prices.

1 and 2 are left from previous versions.

1 may be useful if you plan to run the trade cycle one time for each market per day only.

Main Menu 3: Allocations

This one starts with printing out a huge list of all the markets available to trade...

```
Loading available markets...

1091 markets are available to trade on kucoin
REQ/ETH,    REQ/BTC,    NULS/ETH,    NULS/BTC,    CVC/BTC,
SNT/ETH,    SNT/BTC,    PPT/ETH,    PPT/BTC,    BSV/BTC,
POWR/BTC,   POWR/ETH,   BCD/BTC,    BCD/ETH,    KNC/ETH,
KNC/BTC,    DACC/BTC,   OMG/ETH,    OMG/BTC,    CHSB/BTC,
CHSB/ETH,   MANA/BTC,   AMB/ETH,    MANA/ETH,   AMB/BTC,
ETN/BTC,    DGB/BTC,    DGB/ETH,    QTUM/BTC,   AION/ETH,
AION/BTC,   WTC/BTC,    ENJ/BTC,    ENJ/ETH,    SNX/ETH
```

Then

```
Enter a comma separated list of markets you want to set up allocations for.
Example (AnyCoinCurrency/AnyQuoteCurrency)--->:  btc/usd, ETH/USDT, ada/btc
Upper/lower case doesn't matter
Or Enter <x> to go back...
: |
```

I highly recommend using the market symbol list produced by V-Score to choose what markets to trade!
You can enter any comma separated list of VALID market symbols here of course.

Lets try: btc/usdt, eth/usdt

```
Or Enter <x> to go back...
: btc/usdt, eth/usdt
['BTC/USDT', 'ETH/USDT']
^^^ Do these market symbols look right? <Y/N>: y
```

Say they look right by entering: y

```
We can manually spend half the unallocated quote investment on each coin,
or manually sell half the amount of an unallocated coin, both directly from here.
If the market does not exist in allocations.json file, it will be created.
If the market does exist then the allocations will be added to it with the new investment.
If this is a FIRST TIME SETUP, and if ALL the markets are using the same QUOTE currency,
then we can speed up the setup process by spending the same amount on all coins.
Chose an option...
1. Add/Update each market separately (buying or selling)
2. Spend the same amount of quote currency on every coin (buying only)
----->:
```

Option 1:

```
1. Buy BTC with USDT
2. Sell BTC for USDT
:
```

Buy option...

```
Enter half the USDT allocation to buy BTC with:
```

Now I'm not going to here, but after this the coin is bought with quote currency and the allocations set up in allocations.json for that market. And you will repeat the process for every coin in the list. This is a good option for spending **different** amounts on each coin.

Or option 2:

```
Chose an option...
1. Add/Update each market separately (buying or selling)
2. Spend the same amount of quote currency on every coin (buying only)
----->: 2
Enter half the quote currency allocation to spend on each coin: |
```

Again, I won't do it now, but the bot will spend the same amount on each coin and create the market allocation entry in allocation.json.

If buying fails on a subset of coins, make a new list on them and try again.

Main Menu 4: Parameters

```
-----Parameters Menu-----
1. Change the seconds of delay between trade cycles. Default is 86400 (1 day)
2. Change the minimum price-percent distance between trades. Default is 3 (percent)
3. Equilibrium mode. When set to True the value of remaining coins equals the quote allocation after every trade. Default is FALSE (recommended)
4. Mock or Real trading mode
5. Momentum Filter? (bot waits for highest of min price move OR range of last X bars before trade)
6. Number of Bars in momentum filter
7. Force minimum trade (if price distance for trigger gives smaller than minimum trade size)
<X> SAVE changes and Go Back To Menu
----->;
```

My Recommendations

1. Set to 0 - continuous trade cycle with no pauses
2. Set minimum price-percent distance to 10% for reasonable growth and frequency of trades to 1% for high frequency trading (assuming fees per trade are 0.1%. On Coinbase with 0.5% fees, I'd not go lower than 3%. NOTE: do not type "%" - just type a number like 10.
3. I do not recommend it. But setting it true will keep the quote value of the coin almost equal to the remaining quote allocation, after every trade. Essentially this cuts the trade size in half and slows unbiased growth down.
4. Set to mock if you want to see the trade cycle pump without any risk of trade happening
5. This forces the minimum distance between trades to be greater than the highest high - lowest low of the last X bars. You can set the time frame for which bars to consider.
6. I recommend 4 to 8 for no reason in particular
7. Some people wanted to force a minimum trade size, even if that would be a higher amount than the automatically scaled, and intended, trade size. I don't recommend it, but it could be useful on small accounts.
8. V3.0 - adds Volume Filter - only v-score's above average volume markets, ignores the rest. on V-score options 3 and 4

Main Menu 5: Pay and Register

```
-----Pay and Register-----
The cost of operation is $1 dollar a day if you pay for at least $300 days
The cost is $2 dollars a day if you pay less than $300 dollars (maybe you want to try it for a month? apx ~ $60)

Here are the payment options you can use:
1. Ethereum (ETH), through the ERC20 network. (calculated to dollars before adding expire time to registry)
<X>. Nevermind, go back
----->;
```

It works! Quite a few people have done it and it works every time.

V3.0 - you can now pay with BNB on binance smart chain or KCS on KuCoin's KCC-network chain
TIME paid for and used works differently now

V.3 pay menu:

```
-----Pay and Register-----  
You buy NANOS- nanoseconds at a base rate of $1 for 28 days of nanos (2419200000000000 nanos)  
These are used at rates proportional to the dollar value of allocations above $100.  
No time is ever used up if the total value of your allocations is under $100 (test/ small accounts)  
Someone with a $100-$199.99 account is paying the base rate, one nano gobbled up for one nano time  
Someone with a 1 million dollar account is spending 10,000 nanos for every nano of time between trades  
This makes the payment system fair for all account sizes!
```

Main Menu 6: Trader

```
-----Trader Menu-----  
1. Run Once  
2. Run Continuously  
<X> Go Back  
----->:
```

I wish #2 was a true “set and forget”. Unfortunately Windows does not let you forget. If Windows restarts you’ll have to restart the bot too. Don’t worry, all the data is saved after every trade. Pick up where you left off

Main Menu 7: Reports

```
-----Reports Menu-----  
1. Show and save growth report for all markets and forecast for expected single market growth  
2. Show and save average unbiased growth for all of trading so far.  
3. Show and save HODL vs Volatronix.  
<X> Go Back  
----->: |
```

Each of these options both display the report in the command window and save the report to files/reports directory.

These examples are from about a day and a half of high frequency trading on KuCoin (min distance = 0.5%) making unbiased growths per trade very small, but in about 3 or 4 months we should see an average of 10,000 trades per market.

Option 1:

Gives a growth report like this...

TRIAS/USDT

TotalTrades: 166

TotalBuys: 86

TotalSells: 80

Starting TRIAS investment: 2.1447

Current TRIAS allocation: 2.694

TRIAS amount growth: 0.5493

TRIAS percent growth: 25.61%

Starting USDT investment: 20.42213366

Current USDT allocation: 16.12543656

USDT amount growth: -4.2966971

USDT percent growth: -21.04%

Unbiased Percent Growth of TRIAS/USDT: 2.29%

for every market

As well as a forecast from the trading histories of all traded markets

TotalTrades: 2755

Average Unbiased Growth Per Trade: 0.0036%

***** FORECAST *****

Expected Unbiased Growth of a market at...

100 trades: 0.36%

1000 trades: 3.68%

10000 trades: 43.53%

It has been LESS than two days since I started this on KuCoin, very high frequency trade settings, very small unbiased growth per trade.

There are 15 markets I'm trading here. (one was a dud with almost no trades)

Assuming it was a full 48 hours and assuming no duds...

$2755 / 15 = 183.6$ trades per market in 2 days. ~92 trades in 1 day.

$10,000 / 92 = 108$ ~ approximately three and half months for the average market to get to 10,000 trades with these settings.

Option 2: show unbiased growths of all markets and average unbiased growth of account as well as quote value changes

```
LNCHX/USDT unbiased growth: 0.19%, over 18 trades
LNCHX growth: 7.11%
USDT growth: -6.73%

ETH3L/USDT unbiased growth: 0.84%, over 393 trades
ETH3L growth: 2.58%
USDT growth: -0.9%

TRIAS/USDT unbiased growth: 2.29%, over 166 trades
TRIAS growth: 25.61%
USDT growth: -21.04%

Total Trades So Far: 2755

-----
*NOTE: growth values based on last trade price, not current price of market

Initial USDT allocation: 305.64
Initial value of coins in USDT: 305.64

Current USDT allocated: 301.53
Current value of coins in USDT: 316.72

Initial Combined Value in USDT: 611.28
Current Combined Value USDT: 618.26

AVERAGE UNBIASED GROWTH: 0.48%
```

And it's pretty accurate! This capture below was taken a few minutes later from my KuCoin account balance.

617.73617911 USDT ≈ 618.04 USD

Option 3:

- Early on in trading, if currently in a “Bull Run”, then HODL will **seem** better than trading with the bot.
- But the longer you use it the more you’ll see
 - The bot always beats HODL on “Bear Runs”
 - The bot eventually beats HODL no matter what happens

```

3. Show and save HODL vs Volatronix.
<X> Go Back
----->: 3
What quote currency? : usdt

***** V-Ultra Vs HODL *****

Starting USDT value of all USDT markets: 611.27737653
Ending USDT value of all USDT markets: 618.25558871
USDT change since start: 6.98

Average Price Change Percent of all Markets: 1.46%
USDT account value change percent: 1.14

V-Ultra USDT markets are performing -0.31% better than simply holding crypto at starting investment prices
If this number is negative it is likely because we have not been trading very long and the average price of all markets is going up fast.
Don't worry, constant trading growth is guaranteed to surpass HODL growth the longer you use V-Ultra
<enter> to continue...

```

Now I tested the system on [CoinbasePro](#) with a 10% distance between trades, for a much much longer period of time... check it out...

Proof This Shit Works

My Actual Coinbase Trading Growth Report from 2021.04.20 to 2021.11.?? - Forgot what day I stopped in november, but this is approximately 7 months of trading almost non stop with a 10% min distance between trades

Tools

```
-----Tools Menu-----
1. Check wallet balance options
2. Sync coin allocations to wallet balance amounts
3. Redistribute quote currency options
4. Liquidation options
5. Market list options
6. Market info - examine json info of a market
7. Show available candle timeframes
<X> Go Back
----->:
```

1. Check wallet balance options...

```
1. Free balance of one coin
2. Free balance of all traded coins
3. Free balances of all coins in account on exchange
<X> Go back
----->:
```

2. Synchronizing coin allocations to wallet balance amount **only makes sense if:**
You are NOT trading the same coin against two different quote currencies

3. Redistributing quote currency options...

```
You have 301.5342741822462 of USDT allocated across markets
You have 299.77599518 of USDT actually in your wallet
Difference: -1.7582790022461836

Would you rather...
1. Distribute ACTUAL wallet balance of quote currencies evenly across traded markets?
2. Redistribute sum of ALLOCATED balance of quote currencies evenly across traded markets?
3. Set a new virtual (Fake) quote allocation for each market?
    (Note: Any option resets Initial allocations to equal Current allocations for both
    coin and quote currencies so that forecasting from future trading will remain closer to accurate )
<X>. Done / go back
----->:
```

I wouldn't touch this until you have many thousands of trades.

4. Liquidation options sell the entire free balance of coin(s) to quote currency.

Liquidated markets are removed from allocations.json

```
Liquidation options...
1. Liquidate one coin to quote currency
2. Liquidate all coins to quote currency
<X> Go back
----->: |
```

5. Get comma separated lists that you can input into V-Score, or save for backtesting, whatever.

Also shows available quote currencies

```
Quote currencies...
BTC, DAI, DOGE, ETH, KCS, PAX, TRX, TUSD, USDC, USDT, UST
1. List currently traded markets on quote currency
2. List all markets available on specific quote currency
3. List markets not traded yet on quote currency
<X> Go back
----->:
```

6. You can examine the market data of a single symbol

```
6. Market info - examine json info of a market
7. Show available candle timeframes
<X> Go Back
----->: 6

```

V3.0 - now offers menu option 8 to directly buy or sell market orders, useful for example if you liquidated to BTC and want to immediately convert to USDT or other quote

Version 3.0 notes:

The newest version 3.0 is the final version of V-Ultra.

Only bug fixes from here on out if any are found.

Sending any amount of ETH, BNB, or KCS will register the trader.

It could be as small as a dollar. Or a penny.

GOOD NEWS for users of the previous versions. 3.0 is using new database tables.

Guess what that means?

You can re-use your payment hash!
(If it doesn't work let me know, I may have used it to test the NANOs system)

The NANOs System

\$1 dollar pays for 28 days of nanoseconds. But poor people should not pay as much as rich people. So we do \$1 for each \$100 dollars **ROUNDED DOWN**.

Allocation value of \$199.99 will still give a base rate of \$1 per 28 days.

No NANOs are used up for small accounts or test accounts with allocations under \$100

HOW COOL IS THAT? FAIR? YES

Someone with a \$10,000 account is gobbling up 100 nanos every nanosecond.

Someone with a \$1,000,000 account is gobbling up 10,000 nanos every nanosecond.

Paid trade time is never lost when not using the bot, or when testing functionality with small money.

You don't have to change API keys anymore, all payments add time to the key you already registered.

Known to work on:

CoinbasePro

Binance

BinanceUS

FTX

FTX-US

KuCoin

And probably works on over 100 other exchanges, for sure ones similar to those listed above

Personal Statement

My name is Jeremy Scott. I'm not among those crypto scammers / snakes / wolves / sharks / thieves that you find literally everywhere in the crypto world spamming you dm's about going to the moon and trying to pull you into some shady investment platform or a network marketing scheme using shit coins worth nothing. I'm sick of these types on the net... I hate these people. I've lost a lot to scammers and hackers, but never again! No, I'm not like them and you should stay away from every black box system out there. Especially if you have to trust someone else with your money, and especially if it's on an investment platform with very little presence and popularity on the internet.

I have simply created a perfect trading system that should work on any of over 123 cryptocurrency exchanges. You fund your own account, you control your money. The API keys you'll need for the robot to trade for you will be generated with only the permissions necessary to trade, but NOT transfer or withdraw. Neither I nor the system need any personal information about you for you to trade and profit with Volatronix. Though I'm totally open to you knowing who I am and what I do if you want to investigate.

I'm a real person, honest, transparent, open to talk / meet / zoom. But I probably will not be swayed into whatever your business or gig is. Sorry to say no preemptively, but this is my path, and whether anyone joins me or not, it will make me rich enough to stop working and have time to create other amazing things for people in the future.

I want to help others get rich too while protecting myself from thieves. Maybe if some thieves use this they will stop burglarizing others... Maybe criminals, drug dealers, traffickers can stop committing these crimes for money when they have a universal money tree like this?

My goal is to straddle every market in existence knowing that some of them with Volatronix will make me extremely rich. Then I'll be able to move onto other visions and purposes.

Unrestricted Time Version available for \$2000 direct in cash or crypto or \$2500 on Fiverr (when I set the fiverr option up), comes with up to a full day of [Zoom](#) where I help you set everything up. Without paying for the unrestricted time version I don't offer face to face interaction on Zoom, the manual and Youtube videos should be good enough.
