

GeoMento — Privacy Policy

Last updated: 19 June 2026

GeoMento is a location-based reminder app. This policy explains what information the app uses, where it is stored, and why each permission is requested. In short: your reminders and your location stay on your device. The developer does not collect, receive, or store any of your data.

The short version

- Everything you create — reminders, locations, and settings — is stored only on your device.
- GeoMento has no user accounts and no developer-run servers. Your data is never uploaded to us.
- There are no ads, no analytics, and no tracking.
- Location data is used on your device to trigger reminders, and is sent to Google only when you search for a place or tap the map.

Information stored on your device

The following is saved locally on your phone (in the app's private storage) and is not transmitted to the developer:

- **Reminders:** the title you type, the location you choose (latitude, longitude, and place name), the trigger radius, whether it fires on arrival or departure, and the time it was created.
- **Settings:** your theme, language, notification sound and vibration preferences, quiet hours, and default radius.

Permissions and why they are needed

- **Precise & approximate location** (ACCESS_FINE_LOCATION, ACCESS_COARSE_LOCATION): to show your position on the map and to detect when you enter or leave a reminder's area.
- **Background location** (ACCESS_BACKGROUND_LOCATION): so reminders can trigger even when the app is closed or in the background. This is the core feature of GeoMento — without it, location reminders cannot work while you go about your day.
- **Notifications** (POST_NOTIFICATIONS): to show the reminder when you reach a location.
- **Run at startup** (RECEIVE_BOOT_COMPLETED): Android clears all geofences when the device restarts, so this lets GeoMento re-register your active reminders after a reboot.
- **Network & Wi-Fi state** (INTERNET, ACCESS_WIFI_STATE): to load map tiles, perform location searches, and help the system locate your device accurately.

Maps and location search

GeoMento uses Google Maps Platform (the Maps SDK, Places API, and Geocoding API) to display the map and to find places. When you search for a location or tap the map, your search text and/or the selected coordinates are sent to Google to return results and place names. These requests are handled by Google under Google's own Privacy Policy. GeoMento does not attach your name, email, or any account to these requests.

What GeoMento does not do

- It does not create an account or ask you to sign in.
- It does not upload your reminders or location history to any server.
- It does not show advertising.
- It does not use third-party analytics or tracking tools.
- It does not sell or share your personal information.

Keeping and deleting your data

Because your data lives only on your device, you are always in control of it. You can delete an individual reminder, use “Clear all reminders” in Settings to remove everything at once, or uninstall the app to permanently delete all of its data from your device.

Children's privacy

GeoMento is not directed to children under 13 (or under the minimum age required in your country), and the developer does not knowingly collect any information from children.

Changes to this policy

If this policy changes, the updated version will be published with the app and the date at the top will be revised. Continued use of the app after an update means you accept the revised policy.
