

This is a draft for an update the [Units & symbols page](#) in the Bitcoin Design Guide to close [issue #902](#). This would likely be included under [Visual styling](#), perhaps as the final subheading.

Pluralization

Different pluralization schemes				
Singular	0 bitcoin	0.5 bitcoin	1 bitcoin	2 bitcoin
Plural	0 bitcoin	0.5 bitcoin	1 bitcoin	2 bitcoins
Singular	0 sat	1 sat	100,000 sat	200,000 sat
Plural	0 sats	1 sat	100,000 sats	200,000 sats

Consider the best way to pluralize bitcoin units in your product. Treatment of plurals can differ between languages and cultures. When choosing a pluralization scheme, consider what your users are likely to be accustomed to.

Typically, the word "bitcoin" can mean a singular or a plural. In the [early days of bitcoin](#), it was common to see people use the word "bitcoins" as a plural. This has become a less commonly used word, though it's still grammatically correct. However, it's far more common to see the satoshi (sat) expressed as "satoshis" (sats) when plural.

Whatever pluralization scheme you choose, it's good to be consistent with this choice throughout your product.
