

I seek a developer that would develop a location aware listing application. The scope of the work is to develop:

1 - An android application for buyers to access the listing, browse through the listing, search the listing, comment on the listing, ask questions or request for the listing, give feedback, share the listing, view summary details of the listing, view details of the listing, make payments for the listing, apply for payment reversal, view notification of prime listing on the notification area, manage profile/register, add/edit/delete shopping list, add/edit/delete favourites

2 - An android application for sellers to add/edit/delete listing, search through the listing, Receive queries/comments/service request for listing/recieve payments for the listing/do reversals for payments/filter listing, register, view service requests

3. The delivery will be fully functional android application, website with the back-end access for sellers to login and administer their listings, including APIs for integrations with third party applications.

Please let me know if there is anyone who wish to pick the project. The delivery is one month and payments can be done on achievement of agreed milestones.
