This is for the Victoria's Secret angel body female dimorphic morphotype. It includes all mechanisms for activation of the processes in fat loss genes/rapid-fat-loss (capped to vs angel level) & fast metabolism aligned with this body morphotype, replicating it to a perfect T. Down to thyroid hormone optimized including thyroid conversion efficiency, overall metabolic leanness, mitochondrial biogenesis, and muscle glucose uptake into the entire frame through manipulation of regulatory pathways. Vs model appetite regulation, fat mass control, and endurance capacity through metabolism signal enhancers activating. This changes the skeletal phenotype/morphotype as well to fit this structure. Things to expect are hyperfeminine bone structure from the neck down to the feet, long slender run way legs, slender long limbs, elongated torso, narrow ribcage. The height is left desired.
