Abstract:

Abstract. The abstract written in English must contain: purpose of the paper, methods, result, and novelty within 100-250 words maximum. Purpose: This is where you explain 'why' you undertook this study. If you are presenting new or novel research, explain the problem that you have solved. If you are building upon previous research, briefly explain why you felt it was important to do so. This is your opportunity to let readers know why you chose to study this topic or problem and its relevance. Let them know what your key argument or main finding is. Methods/Study design/approach: This is 'how' you did it. Let readers know exactly what you did to reach your results. For example, did you undertake interviews? Did you carry out an experiment in the lab? What tools, methods, protocols or datasets did you use? Result/Findings: Here you can explain 'what' you found during your study, whether it answers the problem you set out to explore, and whether your hypothesis was confirmed. You need to be very clear and direct and give exact figures, rather than generalize. It's important not to exaggerate or create an expectation that your paper won't fulfill. Novelty/Originality/Value: This is your opportunity to provide readers with an analysis of the value of your results. It's a good idea to ask colleagues whether your analysis is balanced and fair and again, it's important not to exaggerate. You can also conjecture what future research steps could be.

Keywords: Writing Guidelines, Scientific Manuscripts, ISI

1. INTRODUCTION

The introduction must contain a general background (shortly), a literature review (state of the art) in order to record the existing method/solutions, to show which is the best of previous researches and to show the main limitation of the previous researches. It has been contained with at least 5 pieces of literature to justify the novelty of this paper. The introduction should clearly contain the gap analysis (why this research needs to be done? What is the uniqueness of this paper compared to

..... ?) as the basic of the new research question, statements of the new scientific article and main research problems (novelty).

Example of novelty statement or the gap analysis statement in the end of Introduction section (after state of the art of previous research survey): "..... (short summary of background) A few researchers focused on There have been limited studies concerned on Therefore, this research intends to The objectives of this research are"

2. METHODS

The method used should be accompanied by references; the relevant modification should be explained. The procedure and data analysis technique should be emphasized in a literature review article. The stages and analysis of the research must be explained in detail. The methods section should also create a research flowchart and the proposed methods for the research article, while literature reviews or bibliometrics should use CONSORT, PRISMA, ARRIVE, or STROBE. It should also detail how these methods are used or implemented at each stage of the research or proposed method (not just the theory).

3. RESULTS AND DISCUSSION

3.1. Results

The results section and the following discussion section allow the most flexibility in terms of organization and content. In general, the pure, unbiased results should be presented first without interpretation. These results should present the data or the results after applying the techniques outlined in the methods section. The results are

Article title

simply results; they do not draw conclusions. In the results section, the author must write down the research results in logical sequences, according to the research flow. The study results are presented in the form of narrative/textual, tables, or images in the form of graphs or diagrams. Avoid displaying raw data. The authors are required to clearly describe the evaluation result of the study in this section.

The main purpose of the results section is to provide the data from the study so that other researchers can draw their own conclusions and understand fully the basis for the conclusions. A common format for the results section is to present a series of figures and to describe the figures in detail through the text. A good results section presents clear figures with efficient text. The figures should support the assertions in the paper or illustrate the new insights. Where applicable, results should be illustrated in terms of non-dimensional variables.

3.2. Discussion

The discussion section is where the article interprets the results to reach its major conclusions. This is also where the author's opinion enters the picture. The discussion is where the argument is made. Common features of the discussion section include: (1) Provide an accurate assessment of the insights gained from the study. (2) The author needs to compare results with other studies. (3) Effectively contextualize the results within the existing body of knowledge. (4) Acknowledge any limitations or constraints encountered during the research (limitations of study or threats to validity). (5) Offer specific and well-justified recommendations for fellow researchers.

It is important to avoid the following pitfalls: (1) Repetition of results already presented. (2) Introduction of new results that were not previously described in the methods or results sections. (3) Introducing relevant literature that should have been

r. (4) Overemphasizing the significance of findings, especially in cases where statistical significance was not achieved. (5) Downplaying or neglecting the significance of findings when valuable lessons can be derived. (6) Making overly ambitious or overly cautious suggestions for future research or applications.

3.3. Figure and Table Style

Manuscripts can be presented with the support of tables, graphs or images which needed to clarify the results of presentation verbally. Results and discussion is shown clearly and concisely. Figure and format tables is using center alignment. Each of figures and tables are given number and description, as well as referred to the writing. Number and figure title is placed below the image, as shown in Figure 1.

Figure 1. ISI cover

Provisions writing of title figure:

Article title

- 1) The initial letters are capitalized, unless an acronym should be written in capital letters.
- 2) The writing of the corresponding provisions must be uppercase, eg name of province (Central Java), etc.
- 3) Color figures are made in black and white, in order to be readable when printed.
- 4) Figure should not be compressed in order to not chapped.

Number and title of the table is placed on the table which is concerned and made in center alignment. In Table 1, shown the following example of writing the number and title of table. The Table is recommended to not using vertical lines, only horizontal lines (on the header and footer), as for example shown in Table 1.

Table 1. The table form which used, table font is adjusting (not must 11pt)

ID term	DF	ID 173		ID 174		ID 175		ID 176	
		NT	LT/LN	NT	LT/LN	NT	LT/LN	NT	LT/LN

4. CONCLUSION

Conclusions written in one paragraph, presented briefly, narrative, non-bulleted, and conceptual. The research impact must be stated.

ACKNOWLEDGMENT

the Acknowledgment section and the References section must not be numbered.
