Abstract

The manuscript should be in Microsoft word format (doc, docx) written in Times New Roman number 12, justify 1,5 lines spacing on A4 (8.5" x 11") paper size with 3 cm margins, and should adhere to the ICMJE guidelines. The abstract should not exceed 250 words and be structured as follows: Introduction (Background and Objectives), Case Presentation, Conclusion. Keywords provide 3-5 appropriate keywords. Those should be listed alphabetically and separated by a semicolon (;).

Introduction: Text for this section.
Case Presentation: Text for this section.
Conclusion: Text for this section.

Keywords: sample; article; author

Introduction

The introduction should provide adequate background information on the paper's subject, explain the importance of the case, and state a specific study question or purpose [1,2,3].

Case Presentation

The Case Presentation section should describe the study design and methods (including the **patients/participants**, explain the **study design**, **experimental protocol), the statistical methods** used, and the **ethical statement** in the research. (Give information about a comprehensive account of the presenting features, including the medical/social/family history. About the patient's story – please be sensitive to patient confidentially; how did they present?; what is the relevant history/ why is it relevant?; Explain the findings and how they influenced the decisions; Do not use abbreviations for diseases or investigations).

Investigation (If relevant)

All investigations that create a background (baseline) picture are relevant and crucial to management decisions should be discussed in full – including the limitations of investigations. Choose appropriate images and videos to illustrate the point (maintaining patient confidentially)

Differential Diagnosis (If relevant)

Please do not write and list diagnoses. The author should describe how the final diagnosis was teased out. The most critical section needs to be substantially discussed. All working diagnoses need to be substantiated.

Treatment (If relevant)

Include pharmacological and non-pharmacological, e.g., surgery, physiotherapy, supportive care.

Outcomes and Follow Up (If relevant)

Always include follow-up data; this gives readers a clear understanding of the outcome. The follow-up period should be defined. Please state whether the patient has died.

Discussion

The Discussion section should describe mechanisms of pathology/injury, guidelines and their relevance, diagnostic pathways (use diagrams), and the points of interest of the case. Include a very brief summary of similar published cases. A summary of the relevant clinical guideline is important.

Conclusion

Following the discussion of the results, authors should state their conclusions or the significance of their findings.

Acknowledgments

Funding support should be acknowledged, and all those who assisted in the work but did not qualify as authors.

Conflict of Interest

Each manuscript includes a statement describing any financial conflicts of interest, if any exist. The corresponding author must provide this statement on behalf of all authors during the submission process.

References

References should adhere to the **Vancouver (brackets) citing** and referencing style using reference management software (e.g.Mendeley). References must be numbered consecutively according to the order of appearance in the text (not alphabetically).

Figure/Video Captions

Choose what illustrates the care most effectively and ensure that the patient cannot be recognized by cropping the image as close as possible. We encourage colour images and videos.

Patient's Perspective (If any)

This is an important section and allows the patient/next of kin to comment on their experience. This enhances the case report and is strongly encouraged.
