Warhol Design Project

Now that you've learned how to precisely add color to a black and white image, let's apply that knowledge in a fun and personal setting. In this project, you are going to paint several renditions of a picture of yourself and arrange it in a grid. A famous artist that used this technique to develop pop art advertising is Andy Warhol. We are going to mimic this technique to create an original, personal piece of art.

First you will use the on-board camera of the Apple iMac to take your picture. Be creative with your pose so your project will be appealing and interesting! You will apply a filter inside Photoshop to make it look like a black and white sketch, then use your selection and coloring techniques to create the Warhol effect. Remember to use bright colors!

Reflections Design

Design with products, reflections of products and backgrounds.

Your job is to take a group of products and showcase them on a stage that reflects their image to make them seem more appealing and attractive.

Create a new Photoshop document that is 720 x 480 pixels. Create a stage and a background for your products. Place at least three different objects on the stage, the manufacturer logo on the wall, and create a reflection on the stage for each one. All of the products must be made by the same manufacturer. Make sure you orient the objects in the most appealing way and make them look good!
