

## Below some questions/ issues we need support on from H.

- **Authentication:** The bundle aims to provide single-sign-on for all the apps using OAuth2. Hypothesis should allow this type of authentication. **When do 'Third party accounts' ship?** - It's 80% is ready
- Tokens documentation :  
<https://h.readthedocs.io/en/latest/publishers/authorization-grant-tokens/>
- Publisher accounts/ integration doc:  
<https://github.com/hypothesis/publisher-account-test-site>
- Documentation for Third party accounts (namespaced version):  
<https://h.readthedocs.io/en/latest/api/>
- This will also help with the current EIC Hypothesis integration and authentication.
- Current Proxy authentication system - is not user-friendly
- Activity Pages/ search UI for annotations not available for third party account integration
- [https://github.com/bitly/oauth2\\_proxy](https://github.com/bitly/oauth2_proxy) - Proxy tool that will give us all the Hypothes.is pages
- **Elasticsearch version:** Hypothesis expects elasticsearch version 1, which is no longer maintained by the vendor; Hoover expects version 2. Since elasticsearch uses up a lot of memory, and the board has limited resources, it would be preferable to run a single elasticsearch instance. That would require Hypothesis to support elasticsearch version 2 or newer. If Hypothesis supports version 5, we will port Hoover to use it too.
- By Oct - would be ideal to have this update in place
- Nick to get back to us by EO April on this
- **Turn off Google Analytics** on Hypothes.is board/bundle instance
- **Modify Homepage content (on your self hosted hypothes.is instance)** to be able to personalize with liquid investigations branding

- Code patch needed/ there is also a way - API to override specific named assets  
<http://docs.pylonsproject.org/projects/pyramid/en/latest/narr/assets.html#overriding-assets-section>
- Hypothes.is installed on ARM
