## Feedback:

- TokenMint Block Explorer:  
  
Block Explorer is very straightforward and easily navigated  
Search of TTN on <https://explorer-testnet.tokenmint.global/tokens> generated zero hits at time of writing this report  
I really like the Token summary page:  
<https://explorer-testnet.tokenmint.global/token/9c1f5556db0c0edb9c5a1c03719e0414afa3c4bfdc03dcb06b89805a866328cd>
- TokenMint Token Generator:  
The input fields were very straightforward, and i like the popup question marks to help define fields  
I minted an unlimited supply token, and I did not notice the “minting number” field disappear. It might be good to indicate that minting an unlimited supply token is actually 2 steps.
- Cobalt:  
Creation of the wallet is straightforward. An updated wallet was installed on Google Chrome.  
There needs to be a “unhide all” button when inputting your secret phrase, because unclicking each field is very redundant.  
There was a hangup when the 100 TTN tokens were sent, but after a browser refresh, it fixed itself.
- Sphere by Horizen Testnet

Looks and works like Sphere Mainnet.

I am not used to transferring tokens on sidechains, so this is new to me. When you “select a sidechain”, maybe an identification or name of sidechain, in addition to the number, would improve this?

This is my mainnet ZEN address
