

Theory

- 1) Emmet is a plugin for code editors that helps write HTML and CSS faster using short abbreviations that expand into full code.
- 2) A library provides specific functions to use in your code,
A framework controls the overall structure.
- 3) CDN (Content Delivery Network) is a network of servers that delivers files from the nearest location to the user,
Best Example is AWS (It offers us various services like CDN etc, recently it Crashed and most of the platforms took longer to process load throughout the World).
- 4) React is called "React" because it reacts to data changes and efficiently updates our UI.
- 5) The crossorigin attribute is used when loading scripts from another domain to handle security and resource-sharing permissions (CORS).
Use this to check/try this (<https://cors-anywhere.herokuapp.com/corsdemo>).
- 6) React is used to create components and manage UI logic.
ReactDOM is used to render React components to the actual DOM in the browser.
- 7) [React.development.js](#) is Used in development phase (includes warnings and detailed error messages).
[React.production.js](#) is Used in production phase (without errors).
