

Taproot/Schnorr Implementation (**DRAFT in need of feedback**)

- Implementation
 - [secp256k1 #558](#) merged
 - [taproot #17977](#) merged
 - Wtxidrelay items code complete/reviewed/merged
 - [Use wtxid for transaction relay #18044](#) (merged!)
 - [test: Add test for wtxid transaction relay #18446](#) (closed!)
 - [Overhaul transaction request logic #19184](#)
- Testing
 - [signet #18267](#) merged
 - signet with taproot live
 - signet with taproot wallet integration/testing
- Activation
 - If the activation method is a new one, then the code needs to be merged into a release, which could be a major release
 - The *initiation* of activation typically happens on a .1/minor release, not a major release.

Open questions:

1. What is the test plan *before code is merged*?
2. What is the test plan *after code is merged* (but before release)?
 - a. Reset testnet (“won’t make changes more popular”)
 - b. Flag day testnet
 - c. Signet may not be required, but it may be the best choice
 - d. Is it easier/better to fork testnet or use signet?
3. Is wtxid relay required or not?
 - a. Is 19184?
- 4.
